JAKKI BRAMBLES COLUMN

Well OK then you Mums and Dads, it's that time of the year again when letters to Santa are coming your way.

We get a lot of phone calls at this time of year from you guys because it really isn't that easy to decide which of the mega bundles to buy. So this month we have an easy guide to help you make that really important choice.

Amiga 600 Single Drive - The ONLY home computer for less than £200. Suitable for the child fed up with paying out £40 for software for their Megadrive (software available from £9.99) or for the first time buyer. There are hundreds of software titles available including games, education, word processing, home accounts etc. Games available include strategy / role playing, titles where imagination is more important than aggression, learn to create animations not zap aliens aimlessly. Age Group 8 - 13

A600 Hard Drive - A more serious version of the above. The hard drive saves repeatedly loading and swapping floppy disks. Suitable for serious games players and applications such as database management for a student or home office environment. The Epic Pack is particularly useful for a foreign language orientated student. Age Group 12 +

Amiga 1200 Desktop Dynamite - The perfect solution for the student. You want him or her to have a computer to produce

Amiga 1200 Desktop Dynamite - The perfect solution for the student. You want him or her to have a computer to produce school work using quality Desktop Publishing software, he / she wants a dynamic games playing machine. This gives both of you what you are looking for. The software alone is worth over £300. You can expand this computer through the addition of hard drives, extra memory, accelerator boards whatever the option most suitable for producing any number of serious applications. Want to be a graphic artist, video producer, film director, cartoon animator, musician, mathematician, designer..... the only limi-

tation to the machine is your imagination. Age Group 14+

Amiga CD32. The choice for existing Amiga owners looking for the latest product in the range or for the dedicated console owner. Knocks the Sega for six with its State - of - the - Art graphics. (Colours on screen Sega = 64/CD32 = 256 or 262,000) and processing speed (Sega = 16-bit / CD32 = 32-bit) To you or me this means that people who write the games can now display more colours on screen and the action can be even faster. Also be aware this is also a Compact disc player with full four voice stereo sound so you can play your favourite CD's when the kids are at school. Connects to standard TVs and most hi - fi's.

Age Group 10+

I hope this info assists. With Commodores help I'm certain that there will be thousands of happy smiling faces on Christmas Day, but if you're still not sure give Indi a call they will be delighted to help.

P.S. Indi tell me that they are able to extend the "At Home

Service" on most new Commodore products to a full 3 years for as little as £39.99 through their agreement with ICL, the Giant European Warranty Company. Might be worth checking out for that extra peace of mind.

BUY NOW PAY 1994!!!!

AMIGA CD32

Lemmings, Oscar, Diggers

The exterior may be sleek but lurking inside the Amiga CD32 is a technological wonder.

At it's heart is the mightily powerful 68EC020 processor from Motorola. This contains the 32 - bit technology which has made the Amiga 1200 a run-away success throughout Europe, Alongside it is Commodore's unique custom AGA (Advanced Graphics Architecture) chipset—comprising three chips nicknamed Paula, Lisa and Alice.

Together they make Amiga CD32 and awesome powerhouse of high speed graphics and stunning sound capabilities. In fact, the machine can display 256,000 colours on screen (compared to Sega's Mega CD which can only display 64) and has a total colour palette of 16.8 million colours.

Amiga CD32 also comes with a chunky 2 Meg of RAM (that's 15 times more than Mega CD) and a double speed drive. SPECIFICATIONS:

* 14 MHZ 68EC020 processor

* 2 Megs 32 - bit chip RAM

2 Joystick ports/controller ports

* S- video jack

* Composité video jack

* RF output Jack

* Stereo audio jacks

* Keyboard connector/ auxiliary connector

* Full expansion bus

* Headphone jack

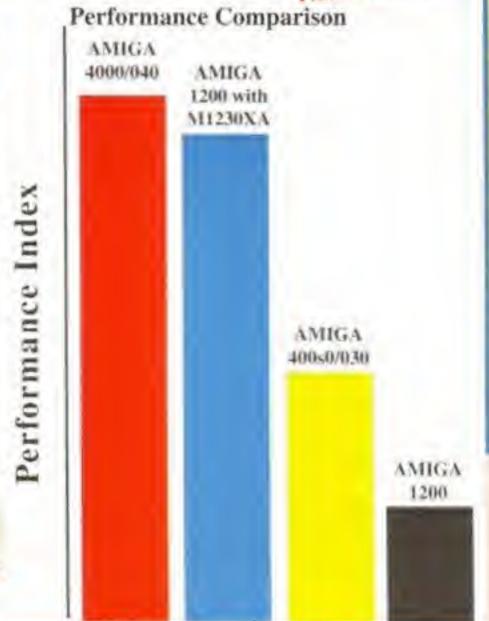

* Headphone volume control

* External brick power supply

* Internal MPEG FMV expansion capability

* Multiple session disc capability

We've said it before and no appologies for repeating it. Adding an Indi Microbotics M1230XA card to your Amiga 1200 turns it into a MACHINE!

CUSTOMER CHARTER

INDI Direct Mall is original and very exciting. Before you buy mail order you must first be confident that you will receive the product you've ordered and that the supplier still be there in the future, should you need them.

A mail order purchase from INDI is a safe and secure decision, and here's why.

INDI is a wholly owned subsidiary of a public company now in it's tenth year of trading and specialising in the supply of computer products.

With a turnover approaching £30 million per annum, we have the resources and the purchasing power to offer you the best deals, deliver them next day nationwide and always be around when you need us. The INDI sales team have been trained to

SALES AND SUPPORT

take your order with the utmost care and efficiency. All stock offered for sale is held in stock, centrally at our group ware house complex and is available for next day delivery, direct to your home or business. If at any time we are out of stock your money will not be banked until the product is available (a point worth checking should you be tempted to purchase elsewhere)

General information regarding product is available from our sales team, however technical support is always on hand should you

All prices quoted are inclusive of VAT.

INDITELESALES TEL 0543 419999 FAX 0543 418079 9am - 7pm Monday to Friday 930am - 430pm Saturday.

CREDIT FACILITIES

INDI are now able to offer competitive credit facilities on all orders over £200. All credit facilities are subject to status and applicants must be over the age of 18.

If you would like a quote simply call our our sales line where acceptance can normally be notified within the hour. We are also able to offer Credit Insurance to cover repayments in the event of sickness or unemployment.

WHY NOT RING FOR A QUOTE. SAMEDAY RESPONSE. (SEE EXAMPLE)

We researched the colour printer market at great depth to find a colour printer good enough to cope with Amiga's powerful output, yet at an affordable price. We found the perfect printer in the KX - P2180 and KX - P2123 quiet printers.

We then considered that if you were going to buy a Panasonic printer you would probably need a quality word processing package to use with it. We found that too, with 'Wordworth' yet at a retail price of £129.99 we thought that might be a little too expensive on top of your printer purchase! So together with Panasonic we decided to give a copy of 'Wordworth' free with every Panasonic printer. How's that for added value?

Panasonic

KX - P2180

Panasonic

Two Smart nieces 1 asterpieces in Colour

The DL1150 Colour and DL1250 are two smart masterpieces from Fujitsu – the second largest computer manufacturer in the world. Thanks to a unique design, these printers will save you a lot of valuable desk space.

The DL1150 is the smaller model and prints in colour on a A3/portrait or A4/landscape. If you need larger printouts, the DL1250 is the perfect choice – it prints on A2 format.

The DL1250 is monochrome but can easily be upgraded to a colour printer by use of an optional colour kit.

The 24-pin dot matrix technology offers high resolution. Many

resident fonts provide a multitude of printout options. You can easily connect your computer with our printers, thanks to Fujitsu's unique DL-menu. Drivers are available, both for Windows and Amiga. For further information please contact your Fujitsu representative, Amiga-Warehouse, Tel. 0753-554338, Fax 0753-551211 or FUJITSU PRINTER PRODUCTS OF EUROPE, Tel 081-573-4444, Fax 081-813-7371 directly.

COMPUTERS, COMMUNICATIONS, MICROELECTRONICS

The editor, Cliff Ramshaw, offers his penny's worth...

So Commodore's restructuring efforts have yet to halt the huge losses the company is currently making. I say "yet to", rather than "falled to", because the magnitude of the losses is decreasing. Perhaps Commodore will be turning in a profit in six months' time.

It's clear that the A1200 and CD32 must succeed if Commodore are to stay afloat. Otherwise it's no more new owners, no more support for existing owners, and a gradually declining base of third-party manufacturers. They're both good machines at good prices, so let's keep our fingers crossed.

At least Commodore's court case shows that they're capable of taking the Amiga as seriously as we do. One worrying thing, though: did they really have to look in a magazine to find a list of productivity software? Imagine the head of Apple saying, "I know there's a word processor available for the Mac, but what on Earth is it called?"

Virus alert

Beware - disk 919 in the Fred Fish collection contains a virus. This disk is also one of the set that appears on Fred Fish's October CD-ROM.

The virus, a particularly dangerous one known as "Saddam Hussein", will only affect machines running either Kickstart 1.2 or 1.3, and can only be activated if the file containing it is run by the user. That file is BBBF/FileVirLib/VirusTo Test/Saddam_Hussein_virus.

Most anti-virus programs, including those supplied with recent issues of Amiga Shopper, will find and remove the virus easily. A safe version of the CD and disk should be available by the time you read this.

comment commodore defend serious Amiga over alleged Acorn slur

n educational video distributed by Acom Computers has forced Commodore into

demonstrating conclusively that the A1200 is capable of far more than just games.

The big C's move comes after Acom began distributing their video via adverts in the national press. Entitled The Home Computer Minefield, the video

was designed to help noncomputer-literates choose the best machine for their needs. You can guess which machine came out on top. (Clue: it wasn't the Amiga.)

Commodore took

exception to a sequence in the film where each contender In turn is removed from the running as it is found unsuitable to run either games, home office or educational software. Commodore believe that the video implies the A1200 is suitable for only games, and that the tape therefore gives a misleading impression about the Acorn machines' competitors. They therefore sued Acorn for defamation of goods (trade libel).

Commodore obtained an interlocutory injunction on 1

November, preventing Acorn from distributing the video for seven days. Commodore produced a long list of Amiga productivity software, culled from a current magazine, to demonstrate their case.

When the court was re-convened a week later, Commodore were able to show to the judge a word-

This is an Acom A3010. Commodore have gone to court to insist that an A1200 can be just as "serious".

processed document, containing text, a headline, scanned picture and signature, very similar to that produced on the Archimedes in the original video. The single-page

document was created by Premier Vision, who managed to produce it in ten minutes to show just how quickly such a thing can be done with the Amiga. At this point, Acorn decided to voluntarily withdraw their video, although they still claim that they intended no slur on their competition. A Commodore spokesman

> commented to us that Acom withdrawing the video yet refusing to admit liability seemed "contradictory".

Acom are in the process of producing a new video, one that happily avoids drawing any comparisons with competing machines. Meanwhile, they have sent letters to all those who have already received copies of the first video (some 17,000 people), correcting any misleading information they may have given about the Amiga.

Commodore had hoped to be given the names and addresses of these recipients, but have had to put up with information from Acom's

solicitors telling them how many corrections have been mailed out. The case is continuing, with Commodore still claiming legal costs and damages.

More zap for Blitz Basic

Acid Software, makers of Blitz Basic, have set up an office in the UK. The new office will enable the company to give UK users of the development language much better support than was possible from Acid's home base in New Zealand.

Acid Software Europe will be selling Blitz Basic II thought by many to be a serious rival to AMOS - for £69.95. The company will also be setting up a user club and a bulletin board system, and distributing the Blitz User Magazine (or BUM, for the acronymically-fixated), which has been published elsewhere in the world for two years now.

The magazine comes with a cover disk, and is particularly important for Blitz users because it often contains additions to the language. The latest edition comes with an AGA display library, plus support for ASL and GadTools. The former means that programmers can take advantage of the features of the newer Amigas such as 24-bit palettes and 64-pixel-wide sprites. The ASL and GadTools support means that applications programmers can use Blitz commands to open Amiga-standard file, font and screen mode requesters, as well as create cycle

Blitz Basic's blinding speed and total control over the hardware makes it ideal for games programmers.

gadgets, radio buttons and list selectors.

You can contact Acid Software Europe on ₹ 071 482 4066. See also our review of Blitz Başic on page 55.

New products at Future Show

AS WELL AS all that games nonsense that we won't concern ourselves with here, the Future Entertainment Show, which took place at Olympia on November 11 to 14, played host to a number of Juicy new products for the discerning Amiga owner.

Most important of these was the Full Motion Video Module for the CD32. The add-on cartridge, demonstrated in prototype form at the show, enables the machine to play back video footage recorded on compact disc. The quality of the images is reckoned to be better than that of VHS videotape. We saw CD32 being used to play back two songs by the Eurythmics - Love Is a Stranger and Sweet Dreams - and a couple of Commodore promotional films, and damned fine they looked, too.

Up to 72 minutes can be fitted on to a single disc, by virtue of a special compression method, known as MPEG, recently agreed by key players in the computer and video industry. The special chips that are needed to decode the video information have

You can achieve high-quality colour prints like this for under £1,000, thanks to Fargo's Primera printer.

only recently been made available, and Commodore are among the first in giving their machine the capability to use them.

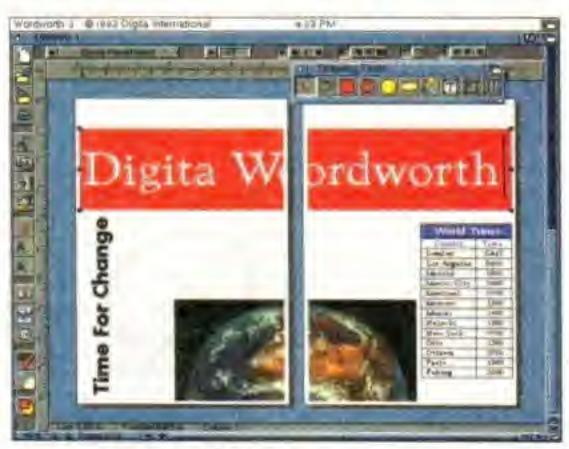

Full Motion Video is expected to create something of a revolution, enabling owners of compatible systems to listen to CDs, watch movies and play music accompanied by video footage, all with the same unit.

Owners of Commodore's CD32 should be able to jump on the bandwagon by the second week of December, when the FMV add-on is expected to go on sale for £199.99. It can only be a matter of time before CD-ROM units, along with compatible FMV modules, are made available for other Amigas.

Fargo Electronics, an American company unknown to most Amiga enthusiasts, were drawing the crowds with their new colour printer. The Primera printer has already enjoyed considerable success in the States among PC and Mac users; Fargo now hope to repeat their performance in the UK by winning over us Amigatypes. Their printer comes in two versions. The cheaper, which creates pages via thermal transfer, comes in at £821.32.

Far better quality can be achieved with the £1,055 dye-sublimation printer, which produces remarkable results, normally achievable with printers costing at least twice the price. (The thermal transfer model can be upgraded to this specification for £234.) Both models come with an Amiga Preferences printer driver, and are available from Power Computing on # 0234 843388.

Power Computing themselves were showing off one or two new

Digita's Wordworth 3 boasts a much-improved user interface as well as a whole load of new features.

products. They're now selling internal versions of their high-density floppy drives, capable of storing 1,76Mb of information on a single disk. Internal models cost £75.95, or £79.95 to fit the A4000. Also from Power is the PC1208 memory expansion card for the A1200. The card will take up to 8Mb of extra memory via plug-in SIMM modules, providing zero wait-state access (which is to say the Amiga's processor never has to walt around for the memory). The card also includes a real-time clock, and space for a 68881 or 68882 maths coprocessor, Prices start from £69.95 for the bare board.

Digita International, show stalwarts that they are, were previewing Wordworth 3 to an eager public. The program promises to be another contender for the title of best Amiga word processor. Among its numerous features are: Auto-Correction, which will correct simple typing errors as well as a acting as a simple macro processor; modularity, meaning you only need to install those parts of Wordworth you need; an improved user interface including a floating toolbar; support for PostScript fonts; better scalable graphics and colour printing; and advanced typographical text effects.

Another byte at sound cherry

America company Digital Audio Design have released Wavetools, a 16-bit direct-to-disk hardware and software combination.

Wavetools will record stereo sounds in AIFF16 file format direct to any Amiga hard drive, with a frequency response of 10Hz to 20kHz. It comes in the form of a Zorro II plug-in card, compatible with the A1500, A2000, A3000 and A4000, though the manufacturers recommend that A1500s and A2000s should be accelerated.

Wavetools' software enables the user to cut and paste between different files and digitally mix tracks. The product maintains an SMPTE time code to enable sounds to be synchronised with video and animations. It costs \$350 and is available from Digital Audio Designs In the US, # 0101 714 562 5926.

Wavetools' direct competitors are of course the long-established AD516 and AD1012 audio cards from SunRize Industries. SunRize have recently announced an upgrade to their accompanying software, Studio Version 3's features include: an intuitive line-based cue list. automatic fades and cross fades, automated mixing, automated punching in and out, external MIDI mixer support, SMPTE chase, assignable tracks and multiple digital audio card support. When used with two AD516 cards, Studio 16 can play back 12 16-bit audio tracks from the Amiga's hard disk.

Studio 16 and the 16-bit, 8-track stereo AD516 card are available from MicroPACE # 0753 551 888 and White Knight # 0992 714 539 for £1,249, while the cheaper Studio 16 with 12-bit, 4-track mono AD1012 option costs £499.

A solution to the thorny problem of fitting hard drives to A600s and A1200s without invalidating their warranties has been announced by trade distributors ZCL.

The company have tied up a deal with ICL, the company contracted by Commodore to provided on-site

maintenance, to provide an "at-home" fitting service, complete with a 12 month warranty. ICL will also extend the warranties by a further 12 months on the machines themselves. The offer is available from independent retailers, Calculus and Indi stores. Call ZCL = 0543 414817 for details.

Cheaper

Indi Direct Mail are selling the Opalvision graphics board at the lowest-ever price of £349.99.

Opalvision is a 24-bit graphics system providing up to 16.7 million colours on screen at once. It will work with the A1500, A2000, A3000 and A4000, fitting into a Zorro II or III slot.

Indi have also committed to offering people who've bought the board from them the forthcoming video modules at discount rates. These modules are expected to give Opalvision capabilities similar to that of the Video Toaster effects board (see page 14). Indi **☎** 0543 419999.

Opalvision

MORE ON YOUR DISK

You can now vastly increase the capacity of your hard drive with Disk Expander, a new utility being distributed by Micro-PACE UK and Power Computing.

Disk Expander works by a similar principle to that of Stacker, the famous PC program: It sits in the background, compressing files as they are saved to disk and decompressing them as they are loaded back into memory. Space savings of between 30 and 70% are claimed to be typical. Disk Expander will work equally well on hard, floppy and RAM disks.

The program installs via
Commodore's easy-to-use Installer
utility, is operated via an "intuitive
interface", and provides statistics on
exactly how much space it is saving
for you with each file processed. You
can get the program to compress
individual files, files grouped in
directories, or entire disk volumes.

Disk Expander costs £39.99 and is available from Micro-PACE UK # 0753 551888. Power Computing (# 0234 843388) are selling it for £30.

Stop

Protect your computer from thieves with the aid of a transfer from the Etching Transfer Company.

The company will place a small identification mark on the screen of your monitor – the mark can be a postcode for private users, or a logo for companies. The mark is impossible to remove without replacing the screen, making the equipment difficult for a thief to sell.

The transfers cost a minimum of £3 for three. Call the Etching Transfer Company on ☎ 0903 244642 for more details.

Commodore announce heavy financial loss

commodore International LTD., parent company of Commodore UK, continue to lose money hand over fist. The company posted figures for the financial year ending 30 June, revealing that they had lost a total of \$356 million.

The figures were announced on 12 November, but were expected to have been released back in August. One industry rumour put the delay down to Commodore hoping that their new CD³² console would gain a foot-hold before shareholders and creditors could panic.

The loss for the final quarter of the year was \$83 million, following a loss of \$177 million in the previous quarter (as reported in Amiga Shopper issue 28). Of the previous quarter's \$177 million loss, \$135 million was accounted for by write-downs of Commodore's assets (they were forced to re-evaluate a large stock of A600s before selling them at the new price of £199.99) and re-structuring, which was to make the company, in **UK Managing Directory David** Pleasance's words, "leaner and meaner". This leaves an operating loss of \$42 million.

Of the final quarter's \$83 million, around \$30 million is said to be an operating loss, the rest again being put down to restructuring costs and inventory write-downs.

The result of all this is that shareholders' equity (the value of all shares) over the last year has dropped from \$325 million to -\$53 million.

Results were also posted for the first quarter, ending 30 September, of the company's current financial year: a loss of \$9.7 million. This brought shareholders' equity down further to -\$61 million.

The Chairman of Commodore
International, Irving Gould, issued the
following statement; "We have made
progress in reducing the net loss.
Having largely completed our
operational restructuring, we are now
planning to undertake a restructuring
of our debts to allow the company to
continue normal operations."

It was also revealed that
Commodore were negotiating credit
terms with some of their suppliers,
who have restricted the company's
credit and instituted legal action.
Commodore have also failed to pay
back two of their lenders according to
agreements made. The loans
amounted to \$33 million, and
Commodore are currently attempting
to negotiate a waiver from the lenders

so they can carry out their debt restructuring plans.

When asked to comment on these figures. Commodore UK's Colin Proudfoot, general manager of operations and finance, told Amiga Shopper: "What we're seeing is sales of A1200s picking up very strongly and CD³² taking off. Restructuring takes time and money. An operating loss of \$9 million in the first quarter compared to \$30 million in the previous quarter represents a big improvement. We're very confident for the future."

Commodore officials claim to be shipping some 22,000 CD³²s a week from their Philippines-based factory. The machine has recently been adopted by John Menzies, who are to stock it and its software in selected stores in their 274-store chain.

Commodore's confidence in the success of the A1200 and CD³² has done little to inspire confidence in one group of Amiga enthusiasts. They have banded together to form the Commodore Shareholders movement, and hope collectively to buy up enough Commodore shares to gain some measure of control over the company and put a stop to what they see as its mismanagement.

ROMBO'S VIDI FINALLY VENIT

Rombo's eagerly-awaited video digitisers, the Vidi Amiga (24) RT and Vidi Amiga (12) RT, are at last ready for release after long delays.

The more basic of the two, Vidi Amiga (12) RT, will digitise pictures with 12-bit colour accuracy in real time (that is, a maximum total of 4,096 colors). Monochrome images can be grabbed in 256 greyscales (but these are only displayable on AGA machines).

The accompanying software provides support for a variety of file formats, including those used on the Mac and PC. It has an image-processing section, providing a number of options including Edge Detect, Threshold, Negative, Light

and Dark. Animation is supported via a module called the Animation Workstation. Vidi Amiga (12) RT costs £199, is comaptible with all Amigas, and is capable of being upgraged to the same specification as Rombo's other new digitiser, the Vidi Amiga (24) RT.

This high-end digitiser is capable of grabbing truecolour, 24-bit images in real time (that is to say, it is capable of distinguishing between 16.7 million different colours), and comes with the same software features as its 12-bit brother. It will take inputs from both SVHS/YC and Composite sources. The Vidi Amiga (24) RT costs £299.

For more details call Rombo \$ 0506 414631.

Epson prices tumble

Epson, already leaders in the 9-pin and 24-pin dot matrix printer markets, aim to improve their standing still further by dropping the recommended retail prices of 11 of their printers.

The price changes are as follows. For Epson's 9-pin range: LX-400 down from £199 to £175, LX-100 from £222 to £187, LX-850+ from £269 to £257, LX-1050 from £398 to £346, FX-870 from £516 to £445, FX-1170 from £645 to £563.

The changes for the 24-pin printers are: LQ-100 down from £253 to £231, LQ-570+ from £398 to £375, LQ-1070+ from £622 to £551, LQ-870 from £704 to £692, LQ-1170 from £880 to £798.

Printer prices from dealers are notoriously lower than those set as recommended retail prices by the manufacturers, so remember to shop around if you're after a printer bargain. For more information call Epson # 0442 61144.

GROUNDS

Galaxy Grafix have released a range of background images, for use in multi-media presentations and video titling, called *Media Backgrounds*.

Each image in the three disk set is an overscanned, high-resolution 16-colour IFF file. Subjects include cameras, books, CDs. phones, textures, a keyboard, videos, and so on. The set costs £14.95 from Galaxy Grafix # 0792 290998.

Software parties

In some circles, computer users sometimes have a reputation for not being very sociable, but 10 Out Of 10 Educational Systems (\$\pi\$ 0742 780370) are looking for people to organise "software parties" to promote their educational packages.

The company will provide you with a party bundle and give you a minimum £5 commission on each sale you make.

The Amiga Shopper Shareware Collection what you'll find on this issue's packed cover disk.

DICE

All Workbenches

DICE, or Dillon's Integrated C Environment, is generally accepted to be the most powerful shareware C development system around for the Amiga, It comes with not only a compiler and linker, but also a fullyfeatured text editor, giving you everything you need to start programming in C. It's also the compiler used by our programming expert Toby Simpson for his Sailing Through C column.

Unlike the other programs on our disk, DICE doesn't come with an icon which you can use to de-compress it. Instead, you need to use the Shell. DICE is stored on the cover disk as two separate archives, each to be de-compressed to its own floppy disk. Naturally, you can put DICE on to your hard disk if you have one.

Full instructions for decompressing DICE and getting your system up and running are given in the cover-mounted book that comes free with this issue. In there you'll also find lots of example programs

you can type in and try for yourself. Have a good read, experiment, and before long you'll be writing your own C programs.

DICE is the compiler used to test

all of the programs in our Sailing Through C programming series, so you can compile all of these with it too. However, you cannot compile programs that make use of graphics library calls and the like without the addition of a set of files known as the Commodore Includes. You can obtain these direct from Commodore (send a cheque for

Business Machines (UK) Ltd, to Sharon McGuffie, Commodore Business Machines (UK),

£25, made payable to Commodore

Commodore House, The Switchback,

Gardener Road, Maidenhead, Berks. SL6 7XA, and ask for the Native Developer's Toolkit) or by paying the \$50 shareware fee and registering DICE. (DICE is shareware, so if you

Roof Slate is a sample image taken from VideoWorld's Nexus Pro range of backgrounds for video work.

intend to keep using it please do register - you'll find details on how to do this in the text file register.doc, which will be in the docs directory once you have de-compressed

everything.). Better still, for £24.95 you can buy the full version of the Complete Amiga C book, which comes with the fully-registered version of DICE and the Commodore Includes, giving you with a complete, professional C environment. See the cover-mounted book for further details, or turn to page 74.

CSOURCE

All Workbenches

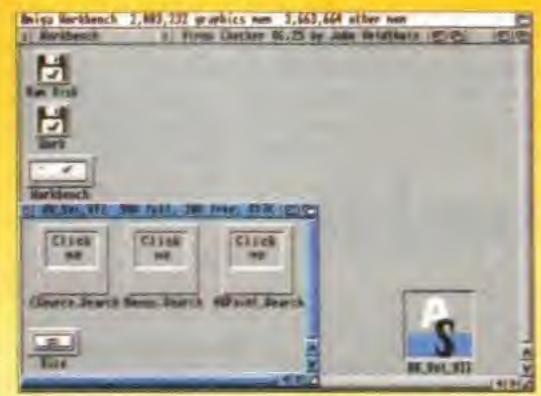

This archive contains the latest set of source code files to accompany our on-going C programming tutorial. Salling Through C (see page 53). Dearchive the files according to the procedure outlined below. You can then load them into a text editor such as DME (as supplied with DICE) to look at the source code. Please note that double-clicking on the files' icons will have no effect.

An executable version of the address book program, called address.x, will be present on the disk you decompress to. You can run this from the Shell by simply typing its name. Remember though to

SO JUST HOW DO YOU GET AT ALL THIS

First you should switch on and boot up your Amiga with Workbench. The programs on the disk have all been compressed, and must be decompressed before they can be properly used. This process is pretty much automatic, so long as you follow the steps detailed here. (See the accompanying cover-mounted book for information on de-compressing DICE.) Before you go any further you need to decide where you want to de-compress the cover disk files to. If you have plenty of RAM, you may want to use the RAM disk. Another option is to de-compress to your hard disk. Alternatively, you'll need to de-compress on to floppy disk. If you choose this last option, then you'll need to have several blank floppies standing by. You can format floppies from the Workbench by single-clicking on their icon and then selecting the Format Disk or Initialize menu option (depending on the version of Workbench you are using).

Now insert the copy that you've made of this month's cover disk. You'll see the Amiga Shopper icon appear on the screen.

The next step is to double-click with the lefthand mouse button on the Amiga Shopper icon. A window for the disk will then open, in which will be displayed the four icons for the software on the disk this month. Apart from DICE, the programs are all stored as archives and can be accessed via the icons shown in the window, whose filenames are terminated with the characters ".Dearch".

3 Let's say that you want to de-compress the Nexus package. You'll need to decide where you want the de-compressed material to be stored, If it's on to a floppy, then insert the disk and open its window. If you want to place the files on to your hard disk or your RAM drive, then open their window Instead. (Bear in mind that the contents of your RAM drive are lost when the power is switched off.)

VITAL: READ THIS FIRST

The first thing that you must do with your cover disk is to protect it from accidents by making sure that it is write-protected. To do this, make sure that the movable plastic tab on the disk is in the open position—that is, you can see through the hole. This means nothing can now be written to the disk, especially viruses. If you don't write-protect your disk and end up with a virus—well, that's your problem.

The next important step is to make a back-up copy of the cover disk – in case any nasty accidents happen while you're busy working with it. The easiest way to go about this is via the Shell. So, open a Shell window and then type the following at the prompt:

diskcopy df0: to df0: Your Amiga will now ask you to insert the SOURCE disk (that's the cover disk) in df0; and then press the [Return] key to continue,

Your computer will now read some of the information from the disk before another System

change directories to the one in which the program is contained; this directory also contains the database file used by the program, which cannot be found otherwise.

The source code for the address book program can be compiled with DICE (also included on this month's cover disk) although you will also need the Commodore Include files before you can create your own executable version (see the section above on DICE for details of this).

Requester window appears asking you to insert the DESTINATION disk (that's the empty disk you want to make a copy of the cover disk on). You'll find that you need to swap disks several times – a System Requester window will appear each time, prompting you to insert the appropriate disk.

If you have more than one floppy drive, you can of course copy from one drive to the other by using the following instruction:

diskcopy df0; to df1;

Right, now that you've made a copy of the cover disk, hide the original in a very safe place and work only with the duplicate.

CAN'T READ THE DISK?

We duplicate tens of thousands of disks, so inevitably a very small number will be corrupted – our copiers do carry out stringent quality-control tests, but the occasional duff disk will always sneak through. You'll know if this has happened to your cover disk

Requester window appearing to tell you that you've not got a DOS disk sitting in your drive, or a System Requester will pop up to tell you just as unhelpfully that a READ ERROR has occurred while one of the programs was de-archiving.

The solution is straightforward.

Just send the faulty disk to the address below, enclosing an envelope addressed to yourself for the return of your replacement disk – the padded variety are best – and we'll pay the return postage. The address is:

Amiga Shopper 33 Discopy Labs PO Box 21

Daventry NN11 5BU h the disk please includ

With the disk please Include a brief note saying what the problem is. Also mention what Amiga you're using and the version of Workbench that you are running. A replacement disk should then come rattling through your letterbox within a couple of weeks.

then load it into your favourite paint package/image-viewer, such as Deluxe Paint or Art Department Professional. The accompanying text document can be read by double-

clicking on its icon.

The Nexus Pro range can be bought with images in both AGA and pre-AGA formats (like the sample provided here). We're reviewing it this issue, so turn to page 32 for our considered verdict.

ASPAINT

All Workbenches

ASPaint is an archive containing the source code to accompany our programming tutorial in our AMOS Action column. It is only of use to you if you own one of Europress Software's AMOS packages.

De-compress the archive according to the instructions given below. Having done that, you can load the resulting file (called ASPaint.AMOS) into AMOS (or AMOS Pro or Easy AMOS) and run it. If you own an AMOS compiler, you can compile the program first for extra speed. As you can see, the program is developing into a sophisticated package, with an extensive set of drawing commands already having been implemented. Study the source code in conjunction with the article beginning on page 101.

THAT GOES WITH IT

If you've got a program that you think will be of interest to Amiga Shopper readers, why not send it in? We're always on the look-out for good utilities or applications that could make the lives of other Amiga enthusiasts easier.

Your program needn't be particularly big or ambitious – just so long as it works and is useful. Then again, we wouldn't balk at a rival to Deluxe Paint, either.

Send your submissions to:

Please be patient waiting for a reply

- we receive a lot of submissions,
and like to evaluate them fully.

NEXUS

All Workbenches

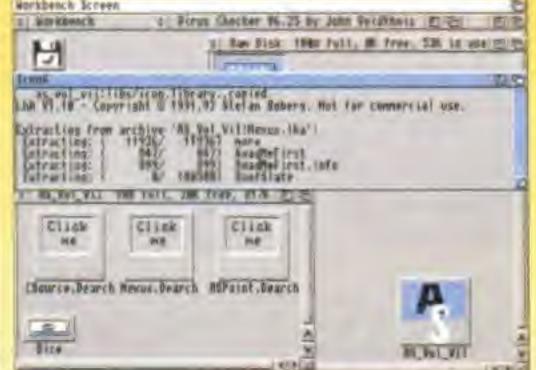

In this archive you'll find a sample image from VideoWorld's Nexus Pro range of background pictures. It's a digitised image of roof slate, in 16 colours and an overscanned resolution of 704 x 566 pixels. Images such as these are ideal for use as, among other things, backdrops to video titles.

To view the image, you must first de-compress it according to the

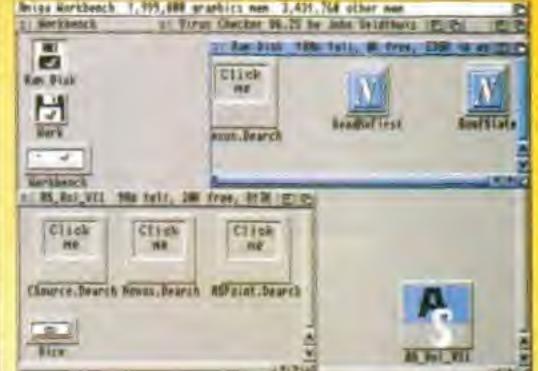

LOVELY SOFTWARE ON YOUR DISK?

Drag the relevant (con (say Nexus.Dearch) into the destination window. (Drag an icon by putting the mouse pointer over it and keeping the left mouse-button pressed. Release the button when you've placed the icon where you want it.) Now double-click on it. The de-compressing procedure will automatically begin, and another window called IconX appears on-screen to tell you how it's going.

In the IconX window will be listed all the files as they are extracted from the archive. If you are using an Amiga with only one disk drive then unfortunately you'll have to get involved with a fair bit of disk swapping. A System Requester window will appear each time you need to swap disks – simply put whichever disk is requested in the Amiga's drive. (Keep the source disk write-protected to be safe.)

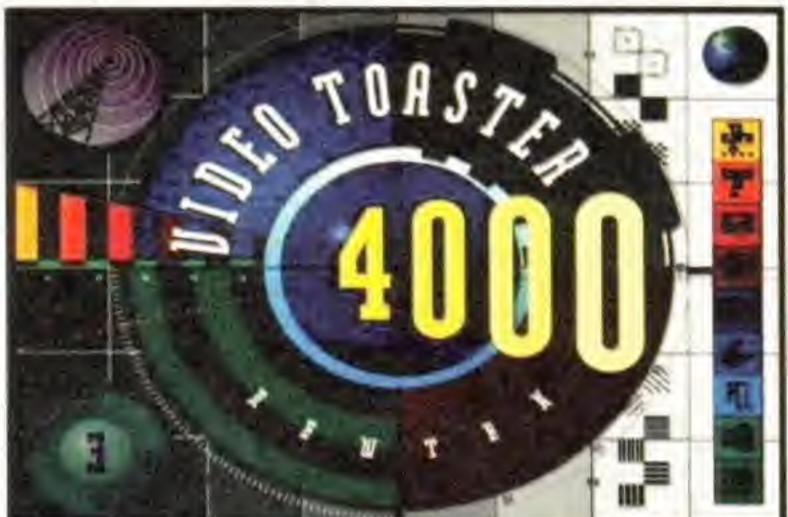

Once the IconX window has vanished the source window will still appear to contain only the Nexus.Dearch icon – that's because the window isn't automatically updated. Click first on the window's close gadget and then open the window again. It will reopen with the packages' icons displayed in their full glory. You can then run the programs or load the files as normal.

Another round of toast

he long-awaited Video Toaster 3.0 has finally become reality, and the hardware now fits not only the A1500/2000 Amigas but also the A3000 and A4000 models. But size is the not the issue here, for the best thing is that the Toaster software has been completely revamped (except for ToasterPaint) and lots of "hot new features" have been added which make me even more envious of my American counterparts in video, graphics and 3D production. Even owners of older Toasters can benefit, for the new software is also available as an upgrade without the Toaster hardware, though some of the new features (most notably 256,000colour Lightwave anims and the "full" set of wipes) will not be available on non-AGA Amigas (that is, A2000 or A3000 models).

Long-standing readers will recall our UK exclusive on the original Toaster way back in Amiga Shopper NewTek have recently upgraded their legendary Video Toaster, making it more desirable than ever. Gary Whiteley drools and dreams of a PAL version...

NewTek's Video Toaster 4000 screen. If you're involved in video effects work, at least in the NTSC-standard-based world, this should be a welcome sight...

mixer with effects, framestores, grabber, keying, character generator, 3D software and more) is to use video standards converters, such as the Prime Image converter reviewed on this page. However, this is an expensive, and not particularly effective, option. In truth the only proper way to do PAL video with a Toaster would be with a PAL version of the Toaster.

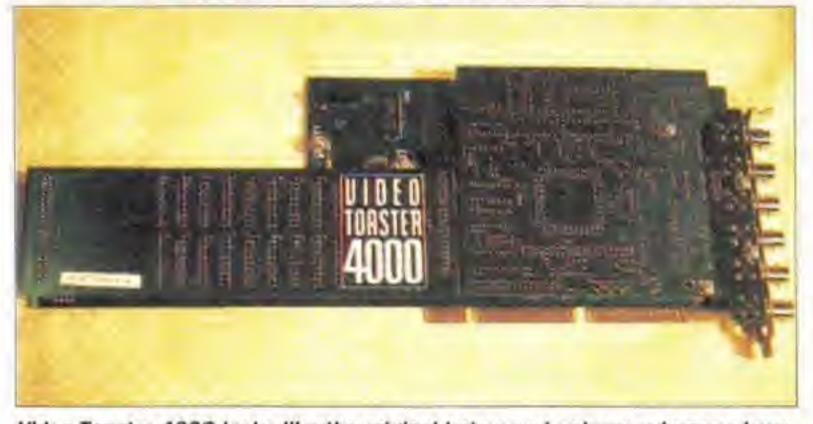

SO WHAT'S NEW?

The most immediate changes can be seen in the Toaster's nerve centre – the Switcher. Better looking layout, and many more wipes and effects – nine banks of 32 effects each are available with the A4000 (that's 288 in total), seven with an A2000 or A3000 (making 224) – including

A single frame from a recent Todd Rundgren video produced using Lightwave and the Video Toaster.

6. Since then two revisions of the software and one of the hardware have come and gone, but a PAL Toaster still hasn't materialised, even though it's two years since NewTek told us to expect one "within 18 months". Right now the only way for UK users to be able to use the Toaster in the way it was intended (as a video

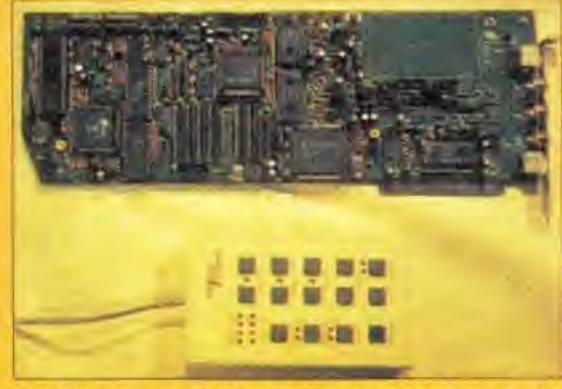

Video Toaster 4000 looks like the original but some hardware advances have been made. Owners of older Toasters can still use the new software though.

PRIME VIEWING?

t's not a PAL Toaster, but the Prime image card has raised the hope of using the Toaster with PAL-standard equipment.

The Prime Image card is actually a TBC (Time Base Corrector), Proc. Amp (Processing Amp) and Standards Converter all rolled into a single internal card that fits any Zorro (or PC) slot. As a TBC it smoothes out hiccups in the timing of a video signal (caused by mechanical fluctuations in the playback mechanism) as it is played back from videotape so the signal can be vision-mixed (switched, in US-speak) with another (TBC'd) offtape signal. Time Base Correction involves replacing the existing synchronisation information of a video signal with a brand-new set of correct

The Prime Image StdCon/TBC and remote unit. That's standards converter and Time Base Corrector, that is.

timings. Several cards can also be genlocked together.

As a Proc Amp it can make

adjustments to the colour, phasing, sharpness and other features of a signal, and also perform Chroma Killing (that is, making the output

monochrome by
"killing" the colour
information in the
video signal). It can
also transcode
between composite
and YC video, and it
can "framestore"
(Field or Frame).

Most importantly in this context, the Prime Image card can convert between PAL, PAL-M, NTSC, NTSC 4.43 and SECAM standards — meaning that it can

he used to convert your PAL output to NTSC, which can then be fed to the Toaster. But that's not the end of the story by a long chalk.

You'll also need a second Prime Image card to convert the Toaster's NTSC output back into a usable PAL signal. And if you want to make full use of the Toaster's excellent Switcher capabilities, you'll need an additional Prime Image card for each video input you plan on using. An Amiga 4000 has four card slots, the Toaster takes up two (the video slot and its adjoining Zorro slot), leaving room for only two Prime Image cards - one channel in and one channel out. Each Prime Image card costs US\$1,695, and the optional remote controls (one required for each card) cost US\$285 each - and you'll need them if you want to use the cards to their maximum potential.

And for what? Let's face it, converting PAL (25 frames per second and 625 lines per frame) to NTSC (30 fps, 525 lines) requires some pretty

Just four examples (out of a range of 288!) illustrating the Toaster's video effects - though single frames can't truly do them the justice they deserve.

some memory-sucking but spectacular animated wipe effects with their own sound tracks (if you have an A4000). In fact some of these effects are so complex that the 6Mb A4000/030 I had on loan for the review actually refused to load them! Spaceship fly-throughs, soft-edged stars, flying logos - these are all part of the Toaster's new Switcher effects, which all seem somewhat faster than in version 2. even though the A4000/030 is probably slower than the accelerated A2000 in which I had a Toaster version 2.

Framestore loading is faster too, even from the A4000's slower IDE drive (slower than my SCSI drives, anyway) and keying also appears a little crisper. And a new option has

* · // (0) BEGGERGHI PAINT CG 35 1 2 3 4 pvi ova pva 1 2 3 4 cv 0v9 0v3 SUPPRIMEDIA -THE R. P. LEWIS CO., LANSING, SPICE. OT WE THE TAKE AUTO S H P NAMED TO A PERSON.

The Switcher, heart of the Toaster, has been cleaned up and expanded to give you even more options, particularly when the Toaster's used with AGA Amigas.

been added to the Switcher's transition speeds, so in addition to the pre-set "Slow", "Medium" and "Fast" speeds, you can also define your own transition speeds.

3D HEAVEN

Lightwave 3D, the Toaster's 3D renderer, has again been widely improved and a whole set of new and exciting features has been added. Bones (a system for making inanimate objects bend, stretch and rotate very easily) is

probably the most outstanding addition, though there are many others - including faster rendering, better lighting, new mapping techniques and much more.

Possibly the biggest bugbear (and one which could well put potential UK users off completely) is that Lightwave's rendering sizes are still preset to NTSC screen resolutions, so PAL users will require an image-processing program to scale the images to PAL sizes (probably losing quality in the process). If NewTek had allowed users to enter the screen sizes themselves (as several other 3D programs do) then anything might be possible. As it is, the choice is, unfortunately, dictated by the Toaster, not the user. Which is all

SYNC STRAINER

Another new product, from PreVue Technologies in the USA, is designed to enable you to use a multi-sync monitor (which must be capable of 15.7kHz operation) with an Amiga/Toaster set-up. It automatically adjusts the sync rates from the Amiga to meet the multisync's requirements, and is said to be all but transparent in use. Price was unknown at the time of writing but if you're curious PreVue can be contacted on # 0101 916 477 2905 or Fax 0101 916 272 1528.

fine and dandy for the average user those of us chafing to use Lightwave

Modeler 3D, the Toaster's 3D "modules", has been given a facelift to bring it more into line with the look and feel of Workbench 2 and 3 buttons and easier-to-use selectors useful) tools and functions have been added to make Modeler more operations, spline curves, text

in the US, but of little comfort to for PAL work.

modelling program, has also been substantially improved and, like many of the Toaster's other cleaner and neater, with better and menus. And lots of new (and powerful, yet easier to use: Boolean

LIGHTRAVE

Warm & Fuzzy Logic (yes, that's really their name!) showed a US\$499 device called LightRave at this year's World of Commodore show in Pasadena, LightRave is a serial port dongle and software combination which fools any Amiga into thinking it has Toaster hardware installed, thus making it theoretically possible for Toaster software such as Lightwave (and presumably Modeler) to run on any Amiga. There do seem to be some potential legal problems, and I'm led to believe that the dongle was itself quickly cracked, making a stand-alone version of Lightwave possible by simple pirating methods - so we may well see NewTek move to kill this product very quickly. It's worth noting too that all the other Toaster functions will not work without authentic Toaster hardware.

nefty compromises. What happens when 100 lines are dropped and where do the five extra frames come from? Immediately we're looking at some significant picture information juggling. And then the Toaster's NTSC output has to have five frames a second removed and 100 lines per frame added. From where - thin air? Of course not! Some frames and lines are inevitably going to be doubled up - or at least concocted out of existing lines and frames to look like new ones (which, of course, they aren't).

The result? A smooth PAL input becomes a jerky, somewhat degraded shadow of its former self, leaving me in no doubt why proper commercial standards converters can easily cost in excess of £10,000 each.

No disrespect to the Prime Image card - it's an impressive TBC/Proc Amp/standards converter for NTSC work - but having to carry the can for

making PAL Video Toasting possible seems a little harsh. Standards conversion is not the answer. A fullspec PAL Video Toaster is. And the sooner this happens the better. Why should America have all the fun? A PAL Toaster would certainly sell by the van load!

The Toaster 4000 is awesome (well, everything except ToasterPaint,

VIDEO TOASTER

LEADERBOARD

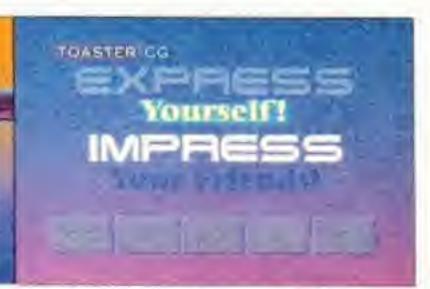

ROUND ONE

6 66 CLARKE

HODGE -4 bB

WHITELEY -3 69 1993 GOLF TOUR

MAKE CAPTIONS WITH EASE TORSTER CO

Some typical examples of ToasterCG work. The Character Generator now even comes with around 280 PostScript fonts - what more could you ask for?

importation, drilling, tapering, bevelling, and displacement mapping, which uses a bitmap image to actually move (or displace) points in an object (unlike bump mapping, which only makes an object appear bumpy).

REFORMED CHARACTERS

ToasterCG (Character Generator) has also had a radical spring clean, and it has become much easier to use and far more flexible, now incorporating on-the-fly PostScript font import and scaling - meaning that a wealth of fonts is now easily available. NewTek even provide around 17Mb of PostScript fonts to get you started - that's around 280 great fonts to use as you wish.

I must say I was very impressed at the way ToasterCG could scroll 300-line text smoothly across the screen, and pleased at the new control the user is given when it comes to layouts - letters can now be selected individually and changed in style, colour or size, or any combination of these, very easily. Colours and sizes can be mixed on lines and justification is quickly achieved, making ToasterCG the program it always should have been.

ChromaFX, the Toaster's filtering system which can do live coloration effects on incoming video images, has not been updated this time around, and though some of the

THE SCREAMER

You might have heard that NewTek are planning to release something called The Screamer around the time you'll be reading this. But in case you don't know what I'm talking about, here's a reminder: The Screamer is a dedicated RISC-based rendering engine for Lightwave, running at up to 600MIPS - which is enough to render Lightwave animations in real time! And although you might think US\$10,000 is a lot to pay for such power, go and check out the competition - you'll then realise just what a bargain it is for the professional CG animator. The rest of us, however, will just have to make do with its rumoured lesser-powered relatives.

effects are very spectacular indeed, I have to admit that I'm still a little intimidated by its workings and it hasn't been made any more accessible.

And so to ToasterPaint, the black sheep of an otherwise outstanding

A much-improved Modeler 3D now sports lats more powerful functions, including Boolean operations, spline curves, bevelling, tapering and heaps more.

collection. Why ToasterPaint remains so neglected is beyond me. It never was the best of paint programs even when it was new, and three years later it looks (and feels) positively dull. As a DigiPaint clone it never really shaped up to the requirements of a 24-bit program, yet the opportunity to improve it has been consistently ignored. I hope this changes soon, because it really does let down the rest of the side.

AS FOR INSTALLATION...

The biggest drawback with the current software is that it comes on 45 disks (29 normal-density disks for non-AGA machines plus an additional 16 high-density disks for AGA Amigas) and you don't get any choice as to which parts of it you wish to install. It's a case of all or nothing.

You can, of course, delete items you don't require after installation (such as the demo images. and animations the AGA animations alone require over 17Mb) - but you can't restore at will from the original disks unless you load the whole lot in again! So make sure you've got a tape streamer or other mega-backup device handy if you want to

N=W =K MODELER 3D

A great example of Lightwave and Modeler's combined modelling and rendering capabilities. Great, even if you never used the rest of the Toaster's features...

chop and change the Toaster softwarel

SYSTEM REQUIREMENTS

The Toaster requires a well-charged Amiga to give of its best. It will run without an accelerator, but an '030

> or '040-equipped Amiga is recommended, as is at least 9 or 10Mb of RAM (18Mb recommended on the Amiga 4000). Loads of hard disk space is also required - 200Mb is probably enough to get you seriously started (the Toaster software alone requires about 120Mb on an A4000 Installation, and

around 90Mb on other machines).

You'll also need a standard RGB monitor such as a Commodore 1084, because the Toaster takes some of its synchronising information from the monitor, or a Sync Strainer if you are using a multisync.

If you want to use PAL video sources you'll need a standards converter and Time Base Corrector for each source and another for the output (see the Prime Image review on page 14). Plus monitors, cameras, videotape recorders, and all the usual video accessories.

If you just want to use Lightwave then you'll need either an NTSCcapable monitor (that's at 3.58MHz, not 4.43MHz - unless you have a standards converter you'll only get monochrome output) or a PAL

monitor and standards converter. (AS)

Gary Whiteley can be contacted by email as drgaz@cix.compulink.co.uk

CHECKOUT TOASTER 4000

Features

What can you say? As the heart of a video post-production system, the Toaster does most of the things the

average (and not-so-average) video producer requires. There are a number of extras I could think of (compositing, image-processing, sound mixing), but what the heck! At \$2,395 the Toaster is still a steal.

Documentation

Very substantial, but would need to be twice as thick to cover all areas fully, even though it already contains loads of good tutorials and information.

Ease of Use

Depends which parts you're using (the 3D side can be quite daunting) but on average the Toaster is quite

Value for Money

straightforward to use.

•••••••• If I were in the US I'd have to say that

the Toaster really is a bargain - at least when you compare like for like. In the UK, considering the extra cost of getting around the PAL incompatibility, it remains an expensive luxury.

Overall rating

I love the Toaster - it's a brilliant idea, well executed and getting better all the time. If I lived in the US it would be great to have one (or more) to use in my video productions. Elsewhere (that is, the greater part of the non-NTSC world) a complete Video Toaster is about as much use to the well-heeled videomaker as a chocolate fireplace though specialists will still find a lot to drool over in the 3D features.

Video dream machine

FrameStore - no, not a shop that frames pictures but another "realtime" digitiser from Germany. Gary Whiteley gets the picture.

t seems like only a couple of issues ago that we reviewed FrameMachine, Electronic Design's real-time digitising card for Amigas with Zorro slots. But that's because it was. (Amiga Shopper 31, in fact - order it on page 106 if you missed it.) Now they've produced an external realtime digitiser suitable for use with any Amiga (including the A1000 if a sultable adaptor is used).

Called FrameStore, the hardware comes in a sturdy plastic case identical to the ones that contain the company's PAL and YC genlocks. It has both YC and composite video inputs, an external power socket. (German-style 2-pin PSU supplied) and an on/off switch on the front. Connection is made to the Amiga via a generously long cable to the

Before use you'll have to load up some software, though if you have a hard disk you can easily install it there. You'll also need to make a few settings to tell FrameStore whether your video source is PAL or NTSC (it can accept either), whether it is from VCR or camera, and if you would like to use overscan.

Next you set up your shot using the Preview feature, which enables you to see the incoming images in black and white in full-screen low or medium resolution. Unfortunately, Preview doesn't update very fast, so users wishing to accurately freeze on specific frames of an incoming video may well experience some difficulties. The frame is captured when the left mouse button is pressed, after which conversion from

FrameStore's native YUVN format (as used in TV systems) can begin.

I grabbed images from a variety of video sources (including PAL YC and composite and NTSC composite) and I was impressed with the quality of the images I was able to grab, though I must admit to being fortunate enough to have a 24-bit card on which to display them in all their glory. Mind you, AGA users will be pretty chuffed too, and even 16colour dithered hi-res images looked quite acceptable. All the grabs of video wipes in the Video Toaster update (see page 14) were made

You don't need a spare Zorro slot to use FrameStore - any Amiga will do!

Given suitable video signals, Electronic Design's FrameStore can provide excellent quality grabs.

rientputets HISS SYSK SEEK HEEK INDE 395 Undo befauls Cancel

It may not have the most spectacular-looking software, but FrameStore is still quite easy to use.

GOING A BUNDLE

There are a couple of surprising extras provided free with the FrameStore. The first is ASDG's Art Department (TAD), which is a forerunner of Art Department Professional (ADPro) and can be used for image processing and picture conversions - though it lacks AGA support and many of the nice features that ADPro now boasts. There's also a trade-up deal. The second extra is Scala 1.13 (AKA VT) - well worth getting for free, even if, like TAD, it is now getting a touch long in the tooth.

BEGINNERS

There are two kinds of digitiser, generally termed "slow scan" or "fast scan". Slow scan digitisers are those which require the incoming video signal to be frozen or completely still, because they capture an image directly from the video signal, a strip at a time. Any movement of the video will show up in the grab as blurring, litters or flickering. Examples of slow scan digitisers are Rombo's Vidi-Amiga 12 and NewTek's DigiView.

Fast scan digitisers, such as VLab, ColourPic and FrameStore, are the "real-time" ones, though this usually only means that the digitiser

BEGINNERS START HERE

can capture a complete frame of video into memory in the time it. takes to be displayed (that is, one 25th of a second in PAL or one 30th in NTSC). This memory is special video memory built into the digitiser. The image is held here as long as needed, allowing you to grab from it any number of times and manipulate the resulting image without fear of not being able to capture the frame again. "Real-time" digitisers however usually take a while to process the grabbed image into something the Amiga can use - typically a minute or so (depending on the grab size

and the Amiga's speed).

BEGINNERS

using FrameStore directly with the Toaster's Program output. (AS)

Requirements

Any Amiga with at least 512K of RAM (though more is required for all modes and screen sizes), and at least AmigaDOS 1.2. An accelerated Amiga, a hard drive and a 24-bit display card are helpful, but not obligatory. Some form of video feed is also required.

000000000 SHOPPING LIST

CHECKOUT FRAMESTORE

Quality

Excellent quality grabbing (if the input is up to scratch).

Documentation

Another fine mess of Anglo-German translation, especially the disk-based help files. Lucky they're not vital ...

Ease of Use

Provided all your connections go well, it's quite easy to get to grips with, and the software is pretty obvious to use.

Speed

It's not the fastest "real-time" digitiser around, but it gets the job done very well, though not as expertly as MacroSystem's VLab, its obvious competitor.

Flexibility

Digitise both PAL and NTSC video, save in 24-bit, YUVN, RGB8 and E-Design's own EDAN format, plus all the current IFF modes, including AGA. Also features colour and other corrections and some limited control over size.

Value for Money

Not particularly cheap, especially when compared to the VLab range.

Overall rating

High-quality grabbing at a relatively high cost, and with less extensive software and functions than VLab. But certainly a digitiser worth taking a closer look at.

We at SOFTWARE DEMON Ltd-would like to wish all our customers past, present and future all the best at Christmas. To celebrate the season of good will we have decided to offer the best items in home computing at a special Christmas price.

EXTERNAL HARD DRIVE UNIT FOR THE B 1200

These external hard drives come in an ABS box styled in match the Amiga AT200. They plug in Viertha PCMCIA doc and include an external PSU so not to invalidate your Commodore warranty. The perfect paintbrush?

his is a 32-bit Zorro 3
graphics card, one of the
most expensive expansions
currently available for the
Amiga. It requires either an A3000
or A4000 with 12Mb of Fast RAM
and 2Mb of Chip RAM – you can
squeeze by with 8Mb of Fast but I
wouldn't recommend it.

Image Engine has two halves.
The first is the hardware: a bestquality RGB framegrabber with
separated sync input, 24-bit

The Image Engine: 32-bit graphics, but only for top-end Amigas – and it'll cost you. You'd better believe it.

framebuffer, 8-bit alpha channel and broadcast-quality encoder. The second half is the software. It's called *Imagica*, and it's a set of simple (and not so simple) graphics paintbrush controls – see the box below for the full lowdown.

Graphics display cards have a

There's a fair choice when it comes to 24-bit graphics cards. Pat McDonald checks out the latest and greatest 32-bit board from G2, Image Engine.

broadly similar design. They've got a memory store for the digital picture information, some finely-designed video circuits to pump out a broadcast-quality signal, and a control processor or two to make the whole thing go. One feature unique

to this card is a nonvolatile graphics store. You're busy on a graphic and there's a power cut or crash. Other cards forget their contents; with this one, just get power back and run Imagica again, and your graphics are unchanged. That one feature alone is pretty impressive for those whose time is precious.

The output is 768 x 576 pixels as

a default, at 15KHz, in other words, broadcast quality – G2 are very careful about calibrating their units. At the top end of the board, near the 9-pin input/output connectors, you can see the RGB and sync test points. But high specification isn't the only reason that the Image

Engine costs so much.

At the other end of the board is the graphics processor – a Texas Instruments 340 DSP. I could blather on about what this chip can do, but it would be a bit irrelevant because a large number of *Imagica's* functions are handled by the Amiga processor, not the TI chip. As G2 keep developing Imagica, more operations will be done by the 340, resulting in much faster operation.

Not that Image Engine is a slouch at the minute. Sure, on 25MHz 68030 machines it takes a couple of seconds to bring up a menu. But when you're actually manipulating a brush, carefully retouching some graphics, you've got a precise tool that works just right.

So it's fast right now, and will get faster as time passes. G2 still haven't recovered anywhere near their development costs, so I think the price will stay as it is for quite some time.

WHAT YOU GET

As standard, G2 supply the board, one lead for output and another for input, a manual and a disk containing the *Imagica* software and a **Harlequin.library** file. Aha, Image Engine is Harlequin compatible! Time

to get some quotes in.

Martin Lowe, of Amiga Centre
Scotland, the authority when it
comes to Active Circuits' Harlequin,
had this to say: "I look on the
appearance of Harlequin-compatible
boards as an accolade to the best
system, rather than a basis to sue
for hundreds of thousands of
pounds. At the moment, Harlequin is
Grafexa-compatible, which is a
stepping stone in between what we
have now and RTG".

Erm, what's RTG?

"Re-targettable Graphics. In other words, a standard to let Workbench programs display on any platform, be it built into the machine or a separate graphics cards. CBM have stated that it will be launched alongside the AAA chipset sometime in 1994".

How Harlequin-compatible is the Image Engine? Not totally, as Dudley Bradfield of G2 explained. "When we say it's Harlequin-compatible, we mean it will work fine with all the support software that you get with a Harlequin. It won't necessarily work with all third-party Harlequin software". It certainly doesn't work with Amiga Centre Scotland's Single Frame Controller (see page 29).

G2 must still be very proud of

IMAGICA: THE BEST AMIGA COMPOSITING SOFTWARE

Want to take elements from two or more different images, and mix them around? Of course you do – image-compositing is a way of taking existing material and making something new with all the pieces. It's not a new technique – Monty Python were doing it years before the word "computer" came into common usage.

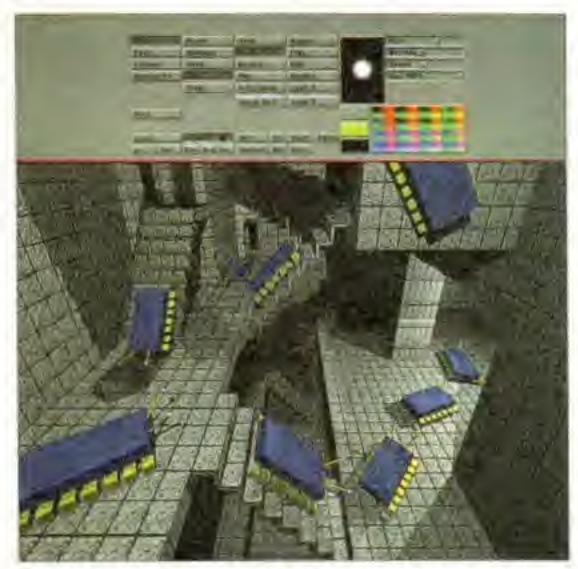

Imagica makes the whole process much more precise, and is at the other end of the quality spectrum. Existing Harlequin users can buy Imagica for use with their graphics cards, although it isn't as fast on a Harlequin as on an Image Engine, and £700 is a lot for a manual and a disk. G2 were thinking of doing an AGA version of Imagica, but with the release of Brilliance they have decided not to bother. (For the low-down on Brilliance, see Amiga Shopper 32 – and turn to page 106 to order a back issue if you missed it.)

Image-compositing is great fun for everyone –
you certainly don't need to be an artist. But,
professional, television compositing is certainly a
specialist market. I can see why G2 don't want to
get involved with competing in the low-price arena.

This is what Imagica has to offer.

- Basic drawing. Imagica powers up showing the contents of its image buffers – two rectangles, black and white. To get the menu to come down, just whip the mouse to the top of the screen. Pulling it down below the menu removes it again. Imagica supports the usual point, line, box, polygons and circles, but the brush is the main drawing tool.
- Everybody knows that interlaced graphics flicker on a 15kHz monitor. If you haven't got anything better (though if you can afford Image Engine, why not?), all you do once you have digitised your graphics is select the solid filter, and Shazam! Interfield jitter is removed (although the picture is slightly blurred as a result).
- The heart of the whole system is the fine brush control, displayed on all menus. The size, subtlety and speed can all be finely controlled via sliders. Of course, custom brushes can be chopped out of the screen, and distorted to your heart's content. That's what makes *Imagica* the perfect paintbrush!

- Want some words slapped on your picture?
 The software will happily load all bitmap and
 Compugraphic fonts, and print them with a brush
 texture (it may be a two-step operation, but it
 does it) and even supports a cutesy feature to
 alter the exact slope of your italics.
- (That's them in the bottom right of the *Imagica* control screen opposite.) Well, if you want to use a precise 256 rating, then you may notice that this colour bar is exactly 256 pixels long. The colour mixer isn't illustrated imagine a box with four corners. Put a colour in each corner, and the intermediate tones are displayed. Quicker and more precise than mixing colours on a palette, although less aesthetically pleasing.
- Special FX deals with digitising (displayed here) and stencil work. Black levels can be tweaked precisely, and the board can lock to an external sync source even if it isn't digitising. You can just hit <F1> and <F2> on the keyboard to stop your picture from jumping.

This composite screenshot shows Imagica in action, modifying a cover image from a recent Amiga Shopper.

the Image Engine though, because they've built a dongle onto the board. Only the supplied version of Imagica will load on a particular board. They could have gone the whole hog and put Imagica on a chip on the board, but that would have made upgrades even more expensive.

One feature that they decided not to use is an ICD connector. G2 designed a transcoder on a board, which could translate composite video and S-VHS signals into RGB for digitising. The trouble is that if you feed such a relatively poor signal into the digitiser, it doesn't really show off how good it is. So they kept Image Engine high-end instead.

It could be a bit of a problem, because there are quite a few studios where RGB video is not used. It means only those with the best quality equipment can even contemplate getting an Image Engine, although of course if you have your own broadcast-quality transcoders then you'll be laughing. If you can't feed it RGB output from a video source, then Image Engine can't digitise anything.

The manual is a hugely unsatisfying book, basically a list of the Imagica controls and a few "how to" pages. However, the nature of Imagica is such that you only use it for occasional reference when you're learning your way around - much more fun than wading through page after page of waffle.

One thing that isn't in the manual (and should be) is how to actually fit the board into an Amiga. Official post-review advice from G2: do not try to mount the board in the bottom slot of your machine, because the weight of the custom hardware chips causes the board to flex, which can cause short circuits.

That's exactly what happened with my A3000. An overlong pin on a capacitor shorted on the case, which killed the 340 processor. Mind you, I was using an ex-demonstration board which wasn't of the same build

quality as a production unit. In typical computer journalism style, they'd sold it to someone before I'd finished. But then it took Dudley about ten minutes to fix.

Remember, Image Engine doesn't fit in the video slot. That means you either need two monitors (one for the Amiga and one for the card) or a switcher box to switch

The top half of Annie Lennox has been given a quick colourised suntan. Took me about a minute to do freehand. Had I used a rectangle command it would have been about four seconds. Easy isn't the word!

inputs to one monitor. Imagica will multitask, but it requires such huge amounts of RAM that you shouldn't expect anything chunky to run.

AND THE KITCHEN SINK

Once you've got it all connected and start loading 24-bit images, one thing is immediately apparent - your monitor picture is dark. That's because the board is working properly and not producing a hot signal like the Amiga. A quick twiddle

Imagica offers brilliant Image-compositing features, but no Undo button - a left mouse button click applies an effect, and a right button click removes it.

and up comes the brightness.

Digitising a grab (you can preview the picture through the board) takes about a second. After that, you can start taking graphics from one image and transferring them to the other. You can do graphic rubthroughs, colourise areas to change the colours while leaving greyscale levels the

same, and generally chop and change to your heart's content.

And you enjoy it. After a few difficult minutes finding out how an option works, you appreciate the vast range of possibilities without ever rendering a computer model again.

What makes it such fun is the brush controls. I don't just mean the display affecting brush operation they're good, but nothing special. What is special is that you hold down the left mouse button to achieve the effect. Or hold down the right mouse button to remove it. Simple. No more

> clicking on Undo, no more cursing after you accidentally remove some important detail. It can be very difficult to remove artists from an Image Engine once they have access to such a simple way of removing mistakes.

Although it takes minutes to get acquainted, it takes a week or so to get really comfortable with the system. You start off by thinking, "Hmm, what should I

try?" After a while you know when an image needs a little blue removed or why something won't quite fit.

C'mon, Pat, there must be something missing. Well, Imagica can't do anything with perspective it's strictly flat-earth territory. But it can rescale and reshape brushes up or down in size very well indeed. And... no, I really can't think of anything else that's missing.

However, this is not a paint program. It's a tool for professional graphics artists. Okay, any Amiga owner can start to get into 24-bit. Nowadays, there's a fair range of 24bit IFF compatible software, for producing top quality graphics on the Amiga. Not just the expensive stuff like ADPro and Morph Plus - more and more cheaper stuff (and even shareware like Digital Illusions and Rend24) give some access to

This is exactly the sort of thing that Image Engine does best - montage graphics into one picture.

professional video quality graphics.

The trouble is that you still have to pay for a 24-bit display to actually see the things. A cheap one like Opalvision costs about £600. A Harlequin with an S-VHS VLab is more like £1,500. The Image Engine's digitiser, frankly, blows that out of the water - it's every bit as good as the full Harlequin's. With Imagica for free, you'd be a bit silly to buy them separately. Or else you really do need a fully compatible Harlequin card and are prepared to pay the difference. (35)

A grand grabber

Rombo's new Vidi-Amiga-12 AGA enables you to grab images from any video source, in AGA modes if your Amiga can handle it. Steve McGill plugs in...

he popular Vidi-Amiga not only offered high-quality grabs, it was cheap (£100) and easy to use – just plug it into your Amiga, boot up the supplied software and connect to a video source – camera, VCR, laserdisc, whatever it was.

The unit plugged directly into the parallel port, the only problem being that the awkward shape blocked off the serial port. Unless you never used the serial port, the constant unplugging of the Vidi unit was tiresome and caused unnecessary wear. Unfortunately, the problem hasn't been redressed with the Vidi-Amiga-12. Rombo offer to sell you a connector to end this inconvenience, so why couldn't they either box the unit in a thinner case or supply it with a ready-fitted ribbon?

That apart, the Vidi-Amiga-12 AGA is a step forward. The software

This image was grabbed from an S-VHS camcorder and saved in interiace format, all in Vidi-Amiga-12 AGA...

interface is much friendlier and more logically laid out than the software of old. The grab preferences and display preferences sections enable you to define the various resolutions and types of grabs you want to take – colour, mono, red, green, or blue. The grabbing panel is easy to use – brightness, contrast and saturation settings are software-controlled – and the Mix control panel offers a plethora of manipulative delights.

Reading the advertising blurb, you could be forgiven for thinking that the unit will grab frames in any resolution – it says Overscan/Hi-Res, HAM-8 and numerous other grab types are available. But the unit can only grab 16 grey scale shades live or 4,096 colours (HAM) at a maximum resolution of 320 x 512 (Lo-res interlace) in less than a second. The clever part of the Mix panel is that it enables the grabs you

Vidi-Amiga-12 AGA's main control screen is much friendlier and more logical than the earlier version's.

have taken be remixed and displayed in a multitude of different resolutions and numbers of colours.

Sequences of frames are now saved as Anim files – great for rotoscoped animations. The mixer can turn a full-colour grab into a 256-colour or 256-greyscale image

(provided that you have an AGA machine, that is), which can be saved in various formats that can be read in by other machines -24-bit IFF, BMP (24bit PC format). 12-bit and TIF, Art Department Professional offers more out-and-out power, but this conversion ability is nothing short of

fabulous, though you need an AGA machine for 256-colour and mono conversions, Hi-res interlace HAM and HAM-8 display, among others.

Image-processing is also catered for. It doesn't offer the range of options that say *Pixmate* and *ADPro* are capable of, but you can batch

The same image, in VHS and low-res, demonstrating the broad range of the Vidi-Amiga-12's capabilities.

process Carousel selected images, and there are Edge Detect, Threshold, Negative, Light and Dark options. The ability to tweak the parameters of these options would have been a nice touch, but you can't have everything. The software will multitask but does not have an ARexx interface - a shame.

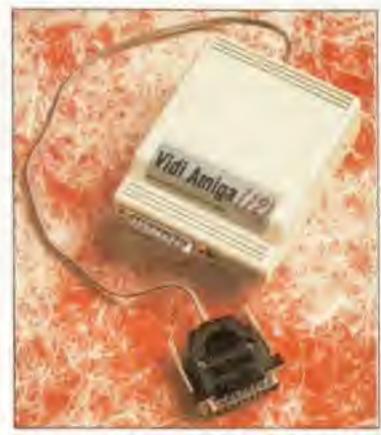

So how well does the unit perform? To put it through its paces, we connected it to a Panasonic MS95B Super-VHS camcorder. The Vidi unit has an S-connector, which means that it can process the higher bandwidth signal that this type of camcorder outputs.

Image quality was impressive. The real test with a unit like this is how well it will reproduce skin tones, and the results were admirable they looked natural and lifelike. There is a marked drop in image quality between Super-VHS and standard VHS. The old adage of "garbage in equals garbage out" holds true. Nevertheless, although the S-VHS grabs were the show stealers, the VHS grabs held their own. Degradation does occur when grabbing from moving tape, but this isn't due to the Vidi unit, it's an inbuilt problem with the medium of videotape. Again though, the S-VHS tape grabs were markedly superior to the standard VHS grabs.

There are some nice little touches in the manual explaining the basics of good grabs; VCRs on Pause are not a good idea for colour grabs. Lighting is probably the single

most important consideration for agreeable results.

All in all, the Vidi-Amiga-12 is a quantum leap up the evolutionary ladder of affordable home frame-grabbing. It could be considered a foundation product – that is, you can build an excellent digitising system round it and it will grow with you. From

Just plug in the Vidi-Amiga-12 AGA and you can grab grandly...

the humble Workbench 1.3 A500 to the mighty A4000, the Vidi performs faultlessly. Whether you're a desktop animator, desktop videographer, desktop publisher or desktop graphic designer, the Vidi-12 has something to offer you. It has to be one of the most exciting creativity-enhancing tools currently available for the digital desktop artist.

SHOPPING LIST

Vidi-Amiga-12 AGA£99.95
From: Rombo Productions,
2 Baird Road, Kirkton
Campus, Livingston,
Scotland EH54 7AZ.

CHECKOUT VIDI-AMIGA-12 AGA

Features

In such an inexpensive unit, the inclusion of an S-Connector, image processing and multi-tasking software is nothing short of excellent.

Documentation

Much better than efforts of old from Rombo – less arrogant, more informative, with useful tutorial and glossary sections.

Ease of Use

It's plug in and go really. Best to familiarise yourself with the software.

Value for Money

Nothing comes close to offering so much for so little. Would be perfect if a parallel ribbon cable were provided.

Overall rating

Unless you intend working with 24-bit colour, the Vidi-Amiga-12 will be with you for years.

Another great offer from a manufacturer you can trust

CCUMANA TO THE STATE OF THE STA

Insiders Guide

Verv special FX

Jeff Walker samples the latest version of a classic image-processing program, ImageFX.

ave you ever spent a couple of hundred guid on some software and, after playing with it for a while, felt that you hadn't got much for your money? No danger of that with ImageFX. The software is packed on to four disks, one of which is full of example pictures and animations; the manuals are a good inch and a half thick in all, compete with a hard manual house for your shelf.

But a thick manual and highquality packaging do not a program make. The question is how well it works. Although ImageFX can be run programs - but it works, it's fast, and it doesn't cost a penny extra.

The load and save modules too all come bundled with the package. Amiga file formats aside, JPEG, TIFF, Targa, BMP, PCX and lots more are there, plus FLC animation files, the standard used by the popular AutoDesk Animator Pro on the PC.

A large number of rendering formats are supported. All the Amiga formats are there of course, plus there are modules that enable you to view your work on a number of popular graphics boards including DCTV, any EGS board, Firecracker24,

HAM-E, IV-24, SAGE, OpalVision and Retina. (Picasso II comes with an ImageFX render module.) And then there's Cinemorph. Morphing is one the most fascinating and absorbing pastimes I know. It's painstaking work and it takes time to get it right. but when you do get it right there's no better effect.

Now, it's worth pointing out that to get all the above facilities with a certain well-known rival imageprocessing package,

it would cost you about £400-£500 all told, perhaps a bit more. And even then you don't get the facility to paint or work on small areas of an image, nor well over 100 other image-processing features that are packed into ImageFX. The scope of the system is mind-boggling. GVP say that if you can imagine it, ImageFX

can make it come to life. That's not quite true, because it is you that has to make it come to life - ImageFX is merely the tool you use. You shouldn't rush into buying it: there is an awful lot to learn. At first you are bound to feel swamped by the infinite possibilities, and it is going to

take some months to become comfortable with the software. Luckily ImageFX has a brilliantly intuitive user interface, which makes the process of experimentation painless. You can

even make up your own user interfaces, and it is not particularly difficult to do.

ARexx support is there of course, and indeed quite a few ARexx scripts are provided, particularly for processing animations.

And all this is perhaps one per cent of ImageFX. This is the sort of software that the Amiga was invented for. True, to get the absolute best out of it you need to own a fast Amiga, a 24-bit graphics card and perhaps a scanner or video digitiser, but then it is a fact of life that the more colours an imageprocessing function has to work on, the better will be the results. That's not to say you can't do a lot with 256-colour and HAM-8 images on an A1200 (with at least 6Mb of memory), but it will take longer and even small tweaks will tend to have a great effect because, although ImageFX always works in true-colour fidelity, if the colour isn't there to start with you can't expect more to just appear out of the blue.

There is only one other package on the Amiga that rivals ImageFX, and that is Black Belt Systems' Imagemaster. If you were to ask me to choose between them I'd rather change the subject and suddenly remember a previous engagement because, a bit like the ProPage and PageStream DTP packages, ImageFX and Imagemaster are very closely matched, destined to leapfrog each other version by version. Each has its

ImageFX includes morphing facilities - the hottest effect since effects were invented - via the Cinemorph program, a "hook" that integrates with ImageFX itself.

The Sharpness and Unsharp Mask facilities enable you to bring out the details in a blurred digitised picture.

annoying little bugs, each can do things the other can't. Both are excellent. If you push me I'd have to say that Imagemaster is faster and a little more powerful in some important areas, but ImageFX is much easier to use and a slicker product overall. (A3)

ImageFX£199.95 Upgrade to v1.50£29.95 By GVP and Nova Design Distributed in the UK by: Silica Systems, 1-4 The Mews, Hatherley Road, Sidcup DA14 4DX. ± 081-309 1111

CHECKOUT IMAGEFX 1.50

Features

Packed to the gills with processing

features - morphing, scanning, animation multi-processor, you name it.

Documentation

"how to" for beginners.

Lots of it, but it could do with more on

Ease of Use

Plenty to learn about, but the excellent interface is a pleasure to use and makes learning fun.

Speed

Complex operations are always going to take a while, but ImageFX is no slouch.

Value for Money

Considering what you get. It is a bargain.

Overall rating

Some of the features are a little underpowered, one or two are bugged, but I'm sure GVP and Nova Design will continue to fix and improve.

Many special effects are created in ImageFX by having a special mask sitting in the alpha buffer between the main and swap buffers. Here a very striking waveform effect has been applied to a digitised image.

from floppy disk, the sheer size of the system is going to make it a very frustrating experience. Really, if you haven't got a hard drive I'd stay away from ImageFX. It will take up more than 3Mb of your hard disk, though installation is painless using the standard Commodore Installer.

As you install it, you soon realise you've got an awful lot of software for your money. For example, six scanning and video digitising modules are provided. The popular Epson GT-6500 flatbed scanner is extremely well supported, as is the Sharp JX-100, the IV-24 and PP&S Framegrabbers, and the wonderful V-Lab. All these devices can be used to pull pictures straight into ImageFX.

There's even a data-caching system that will use hard disk space to store image data when your real memory runs out. It's not real virtual memory - you can't use it to run

Power for art's sake

Steve McGill looks into the new 24-bit graphics board, Village Tronic's Picasso II.

he problem with 24-bit display cards for the Amiga is that often they cost more than half the price of a new A4000/030 - the Retina card for instance sells at around £499. So the Picasso II retargettable graphics board sounds like a great deal at only £300.

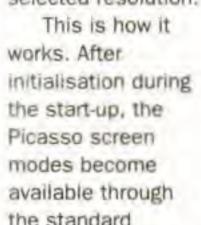

But it's not quite that simple. You need a multisync monitor to use it, and sadly Commodore's 1940 and 1942 are no use - their minimum vertical rate or line frequency isn't high enough for the 800 x 600 resolution, so you need something like the Microvitec monitor reviewed

this is simple too, and copies several files and programs into your hard drive directories. One of the most important of these files is the Village.library. Located in your Sys:Expansion drawer, this is the link between the card and Intuition. This library chooses the correct resolution for your monitor and only lets you use resolutions that are possible. This is probably just as well, considering that the manual is littered with disclaimers accepting no responsibility if you damage your equipment - not very encouraging!

The other important file is the Picasso-Monitor file. This file is an

> expansion on some of the more needed operating system routines. Any legallycoded program's routines are intercepted and can be displayed at your selected resolution.

This is how it works. After initialisation during the start-up, the Picasso screen modes become the standard

Workbench Screen modes prefs. This lets you choose from the resolutions that are available. Say, for example, that you decide to open ProPage or a similar operating-system-friendly program. Assuming that this is the first time you're doing so since installation of Picasso, the Changescreen program intercepts and offers a choice of screen modes. You can specify whether or not the change should be permanent. If you've chosen permanent, the next

time you load ProPage, Change-

screen remembers the specified change and automatically opens your preferred screen mode. The result is that in use Picasso becomes all but transparent.

This would all be lovely if all programs that you used behaved themselves and went through the operating system before

opening screens and such. Unfortunately. this is not the case. Deluxe Paint for example writes directly to Chip RAM. Normally no problem.

but if you want to use DPaint with Picasso, you could be in trouble.

Luckily, Picasso has a Copy Continuously mode. This copies the contents of Chip RAM directly to Picasso's V-RAM (Video RAM). The downside of this is that your V-RAM and your Chip RAM are in constant use, which limits memory capacity overall. It also results in slow screen

refreshes, with the occasional piece of residual garbage for good measure. Nevertheless, it further enhances the uses to which you can put your Picasso.

It doesn't stop here. There are several module drivers for programs capable of displaying much higher resolutions and numbers of colours.

In this particular instance, the drivers supplied are for Art Department Professional and Image FX. Village Tronic are also currently working on Real 3D. With these modules in place, Picasso always tries to display in full 24-bit colour, though 1Mb Picassos are limited to a screen resolution of 640 x 480. Smaller pictures are automatically centred.

Also supplied with Picasso is a copy of Personal Paint lite. While this is easy to use and capable of displaying 256-colour screens, it doesn't use the higher resolutions that the Picasso is capable of displaying, there's no documentation supplied for it, and all the menu

£299, 2Mb £329 By: Village Tronic Distributed in the UK by: Blittersoft, Denbigh House, Denbigh Road, Bletchley, Milton Keynes, Bucks. MK1 1YP. **☎** 0908 220196

The Picasso II graphics card: for 24-bit graphics, plug it in and connect RGB output and a multisync monitor.

screens are in German. Just as well it's free, really.

All in all, Picasso can be recommended. It's disconcerting knowing that you can damage your equipment if you set the software up wrongly, but with a bit of care, professionals and amateurs alike will find that Picasso offers a high quality-to-price ratio.

This 256-colour Personal Paint image shows the kind of resolution Picasso II can offer on the right monitor.

CHECKOUT PICASSO II

Features

Well constructed board with many uses.

Documentation

Friendly and informative. One of the few manuals where the translation process doesn't get in the way too much. Shame about the lack of documentation

for Personal Paint lite.

Ease of Use

Could hardly be easier. Only dedicated

technophobes will have any real problems with the board.

Value for Money

Good value for money. Consider though

that you will have to budget for a multisync monitor as well.

Overall rating

A good introduction into the world of 24bit and Hi-res displays.

A special routine can automatically open OS-friendly programs using your pre-set preferred screen mode.

on page 33. Also, the Picasso II needs a Zorro II/III slot, so it's for A1500/2000/3000s and A4000s.

The card is however well made and easy to fit, though to connect its 15-pin output socket to the Amiga's 23-pin RGB port you'll need a 23-way female-to-15-pin-female adaptor. Considering that you aren't going to be able to use the board without one, it should have been supplied.

Unlike the Retina card, the Picasso acts as a pass-through until activated by its software. Installing

With the supplied modules for ADPro and ImageFX, Picasso always tries to display in full 24-bit colour.

Dr Caligari's magic cabinet?

et's start by getting a few things straight. The new Caligari 24 can do most of the things that other 3D programs do - render, rotate, transform, and just about animate with the notable exceptions of algorithmic texturing, seeing exactly where you are placing a light (the nearest it gets is a view from any selected light), object morphing and selectable output format for full-renders.

On the plus side, Caligari 24 can import objects from Lightwave, Videoscape, Sculpt, Imagine and DXF formats (just as well, since its modelling functions aren't the best I've ever seen, as a look at the demo objects supplied will soon confirm). It also has a nice line in object deformations and produces rather spiffy-looking images (even though it doesn't ray-trace). It can also make animations, using heirarchical object movement if necessary.

But on the minus side: Caligari 24 needs almost 5Mb of hard disk space to install and oodles of memory to run; it has a dongle (another for the collection!); it doesn't render particularly fast (it certainly doesn't live up to its claim of being "the fastest renderer on the market"); and it doesn't multitask.

All of which leaves it looking somewhat crude and dated on the Amiga, compared with programs such as Real 3D 2, Imagine and especially Lightwave, though that is of course only available with NewTek's Video Toaster. All of this is rather sad, considering that Octree pioneered the "all-round" 3D approach on the Amiga (now so acclaimed in Lightwave) and also the use of environment mapping for simulating reflective objects.

Now, many of these gripes aren't particularly serious, because other programs have similar requirements or problems, but surely after five years it's time Octree did something

Possibly the best thing about Caligari 24 is its world view, though implementing hidden-line removal would help to show which objects were behind which.

The new Caligari 24 is being touted as the best, or at any rate the fastest, 3D renderer on the Amiga. Gary Whiteley looks closely at how it shapes up...

Although it can produce stunning images like this, I'm afraid Caligari 24 needs outside help to get around a number of problems. Here I've used objects supplied with Lightwave, and imported a 24-bit background as a .6rn file. Total rendering time: 40 minutes.

about multitasking, which is still one of the Amiga's special features. And while they're at it, implementing a few of the standard Amiga functions (like double-clicking to select files) wouldn't go amiss either.

I mean, what's the use of having a rendering in progress and not being able to do anything else? And, since not multitasking means that it has free run of the Amiga, why does Caligari 24 render relatively slowly and use up so much memory? Surely Caligari 24 doesn't need to take over the Amiga in order to do its "realtime" wireframe tricks - other programs don't.

THE BIG PICTURE

What's more, names can be deceptive, because Caligari 24 can't save 24-bit images! Depending on the Amiga in use, it will save HAM, HAM-8, 16-colour, DCTV, HAM-E or 32-bit (in Octree's own .6rn Rendition format). Mind you, the

HAM and 16-colour images don't look that brilliant and HAM-E is long since defunct.

Now, Rendition format is all very well, but what happens when you want to use a .6m image in another program, or import an IFF image into Caligari 24? Octree don't supply a converter, so it's down to third-party software such as

GVP's ImageFX or ASDG's ADPro (plus the Rendition module from the **ProConversion** pack). Not a very bright move on Octree's part especially since 24bit display devices are becoming increasingly popular on the Amiga.

l also had a problem when using my Opalvision card as a framebuffer (which Caligari 24 supports, along with several other leading display

cards) - it proved impossible to actually save a rendered image, even in .6m format. I tried, but it never seemed to happen. More often than not I was left locked out, watching an endlessly ticking clock icon and Ittle else. A three finger restart was the only apparent solution. Again, not very bright!

THE VIDEO

Then there's the video - a great example of a poor-quality piece of hype. The examples are admittedly pretty impressive, but there's no demonstration of how they were generated by Caligari 24 alone, as claimed. The tour of the menus (which makes up a large part of the tape) is both dull and difficult to read, and the impression I was left with was of a promo tape packaged as an educational aid, although somehow it still manages to provide a reasonable, if basic, introduction to the program.

I'm loathe to recommend Caligari 24 over Imagine, Real 3D 2 or Lightwave, for several reasons: its hardware requirements are high, rendering time isn't anything special, its modelling could be improved (although "Deform" is rather nice),

000000000 SHOPPING LIST

Caligari 24£99.95 By Octree Software, Inc. From Amiga Centre Scotland, Harlequin House, Walkerburn, Peeblesshire, Scotland, EH43 6AZ. **= 0896 87583**.

there are too many separate (and sometimes incomprehensible) menus, memory usage is verging on the insane and it doesn't multitask. Maybe it's just me, but I really don't find Caligari 24 at all easy to use and it seems to require a lot more input than is returned in output. I'll stick with Imagine 2 for the time being. though having had a glimpse of Lightwave 31 know which side of the Atlantic I'd rather have an Amiga on at the moment. $\mathbf{\omega}$

Requirements

Caligari 24 needs almost 5Mb of hard disk space for all its installable files; an accelerator isn't obligatory but it would be very helpful and "a lot" of RAM (preferably 32-bit) is recommended - that is, 5Mb to 20Mb should probably suffice (phew!). A framebuffer or 24-bit display card will also be useful if you want top-quality output.

CHECKOUT CALIGARI 24

Features

Caligari 24 does have its fair share of features, though they aren't always easy to get at, or even make sense of.

Documentation

The manual looks pretty, and helps in many respects, but it seems top-heavy on theory rather than practice. The video has the makings of a fine demo

tape, but isn't really much of a tutorial. Ease of Use

. Only rarely straightforward - it's mostly frustrating and lacks many of the nice touches common in rival 3D software.

Speed

I'd expected much better rendering speeds. Certainly not the fastest.

Value for Money

Recently dropped from £299, the price might just be good enough to attract

new buyers, though it will do little to address the program's real problems.

Overall rating

I'm afraid that Caligari 24 really isn't "the sophisticated and affordable tool" it claims to be. Maybe two years ago. but not now. Even at £99.95.

Absolute perfect timing

Amiga Centre Scotland have brought out a Single Frame Controller for taping graphics. Pat McDonald puts it through its paces.

hat would you say
to £390 for a cable
and a disk? It's a
fair slice of cash,
but it's a professional Amiga-based
solution to what can be a costly
problem – recording an exact
sequence of Amiga graphics frames
of a precise length onto a broadcast
videotape at the correct place.

Why not just mix all the graphics into a Deluxe Paint animation and tape it on your home video recorder? Total cost: ten quid. Yes, and it would look like it too. Plus you'd need huge amounts of RAM to store your animation in — something you don't need with the SFC.

Mind you, you do need a video recorder that uses SM

recorder that uses SMPTE time code, has a 9-pin RS-422 control interface, and is accurate down to the last frame. For the purpose of this review we hired a Sony PVW 2850, a snip compared to buying it for £12,500.

Now you're thinking that anyone with access to that sort of equipment has no need for a mere Amiga and

software reads the type of VTR down the cable, and comes up with a group of pre-set control settings.

Assuming you know what step delay and similar technobabble to feed into the damn thing, you're away.

Once past that, you are left with a quite well designed VTR front-end, showing the VTR type, the current SMPTE tape position, the time code

The well-designed but largely superfluous front control panel of the Single Frame Controller. Notice the status messages as the software performs a take.

in use, and features. To be honest it really doesn't give you more information than the display on the VTR, but it does make things convenient. At the bottom of the display you are given reports on the current state of play.

Just click on the anim button to start building your production. First,

black a tape with timecode if you haven't got a blacked tape – this can be done with the software but again is a standard feature of a single-frame VTR. Next, click on the time code box and enter a start point –

Building up an edit list is largely a matter of finding the correct file with a file requester, then saying how many frames of the videotape you want it displayed for.

its AGA graphics. Well, as well as working to all Amiga graphics standards (colour or greyscale), the SFC can drive the Harlequin, (V24, Opalvision, Firecracker, Image 24, DCTV and Video Toaster. (It did not drive the Image Engine properly.)

Setting it up is very easy, but the SFC does expect a hard-drive-based system. With power off, connect your genlocked Amiga graphics signal to the single frame VTR, and plug the cable into the serial port of each machine. Power up, install SFC and any relevant graphics drivers, then double-click on the icon to get going.

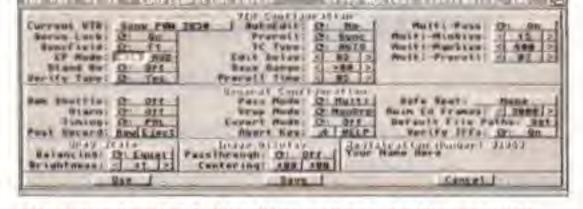

The next step is trickier. The

otherwise the software defaults to 00:00:00:00:00. Next, click on **Input** list, and find some graphics with the file requester.

If the graphic is a single frame, then only one entry will be made on the list. If the graphic is an ANIM-5 or

ANIM-8 sequence of frames, then one line will be added for each frame. Next to each line is the frame count, which defaults to 1 but can be increased to "hold" on a frame.

Once you have a

You have to admit, the front options on the panel to SFC are a little bit much for the video novice.

graphic list, then you can either get it onto tape straight away or preview it. These graphic previews can require a lot of memory – but they are quarter-screen, black-and-white jobs, so you can get a few seconds or so in a 2Mb machine.

Anyway, once
you're happy that the
list is correct, you can print it, save
it, or set the computer to "go" and
watch the automated process. Each
frame took about 40 seconds to
record, plus about a minute of
setting up and finishing off.

If you have a 900-frame segment to produce, it will take about ten hours. A preview would take about 45 minutes to generate, but it would need a lot of memory to generate in one go. All list assembly and previews can be done offline – you don't need a VTR connected until you actually want to record.

That's the good part about SFC.

If you haven't got enough RAM to do something, then you can use fewer frames at a step without missing anything out of the final production.

The only catch is that it won't touch files that cannot physically fit in RAM – If you have a long disk ANIM that won't decompress into memory, you'll have to slice parts of it manually before SFC can handle it.

The SFC is fully ARexx controllable, so you can render frames straight onto videotape if you want – and if you are very sure of what you're doing; but then again if you are working in a studio environment on a day to day basis, it's faster to type your editing commands than to point and click.

All the ARexx commands are covered in the quite excellent manual, which somehow manages to cover everything from the bare bones to a guide to troubleshooting when

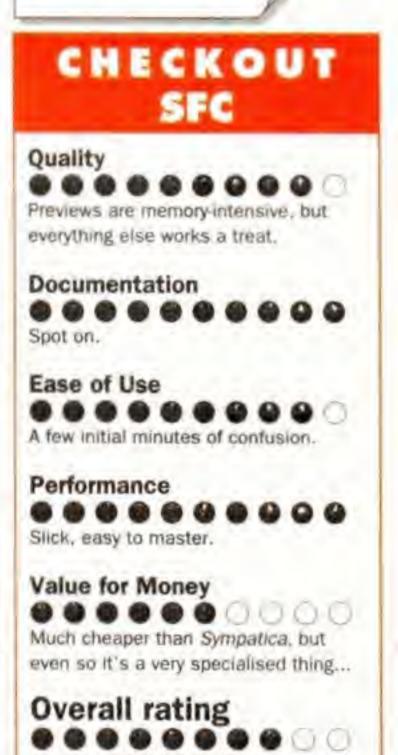

The Single Frame Controller connects a video recorder to your Amiga's serial port, via some built-in circuitry.

you're dealing with certain VTRs. It's quite obvious to me that a lot of time and trouble has gone into making this program as good as it is.

I like this solution a lot, but to be honest there's no way I could justify buying it. If you want to get into the business of transferring Amiga graphics onto professional quality video, then this does it very easily. Takes about 15 minutes to master and then you can arrange your graphics to your heart's content.

A solid, professional utility.

x drive

The 1.76MB Disk Drive* can be used with any Amiga. With the 'XL Drive' you can fit a massive 1.76MB on a high density floppy disk, the drive can also act as a standard 880K drive and can also read & write disks written on an Amiga 4000 internal HD drive.

External XL Drive£85
Internal XL Drive£75
A4000 Internal XL Drive£75 *Requires KickStart 2 or above.

exclusiveproducts

pc880upgrade

Power Computing can now upgrade your PC880 drive from a 880K to a 1.76MB high density drive, all you need to do is check that you have the serial number 'Sony MFD17W-22' on your disk drive casing. (You'll need to unscrew the casing. This does not affect the warranty)

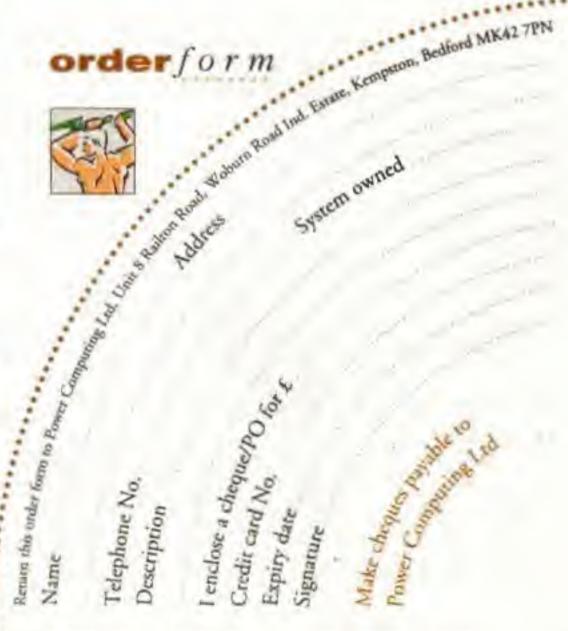

PC880 Interface upgrade £49.95

diskexpander

This Easy to use and install expander can add 60% to your Hard Drive capacity. It quickly compresses and decompresses data and is very reliable ensuring no data corruption. It works with all drives, SCSI, IDE, floppies, even RAD disk and is expandable as new compression libraries are developed.

Disk Expander £35

Commodore 1942 monitor

ith the advent of the new AGAchipset Amigas such as the A1200 and A4000, even buying a monitor isn't as simple as it used to be.

Back in the old days, any standard RGB monitor would happily display the entire range of Amiga

Commodore's 1942 monitor - solid construction, tube by Philips, Amiga-colour-coordinated... and multisync!

screen modes, but the AGA chipset offers a number of new screen modes that are incompatible with standard RGB monitors. These "DBL" modes offer much better picture definition and even rid the Amiga of the dreaded interlace flicker that plagues high-resolution screens

on pre-AGA Amigas. They do this by operating at twice the horizontal scan rate of conventional Amiga displays, meaning they require a monitor that can keep up. This is exactly what Commodore have come up with in the new 1942 monitor.

The 1942 is actually a "dual sync" monitor - it is capable of

> displaying not only the higher speed DBL screen modes. but the standard Amiga screen modes too. Not impressed? You'd be surprised how many multisyncs can't handle the slower 15.75 kHz signals and therefore can't display software that by-passes Workbench 3.0's "mode promotion" facility (which bumps up the display mode automatically). This includes the many games that "hit the

hardware", which makes them impossible to convert to DBL format.

The cream casing matches the AGA Amigas, and as you'd expect from Commodore, the build quality is very good too. All the controls (which are located behind a flip-down panel on the front of the monitor) have a

very positive and responsive feel to them. The 1942 has a high dot pitch of 0.28, which means it offers better picture resolution than, for example, Commodore's other new monitor, the 1940, which has a rather mediocre 0.39 dot pitch (but is £100 cheaper).

The 1942 comes with a "hard wired" lead that ends in a VGA-like 15-pin D connector (the kind used by PCs). Thankfully Commodore include a suitable adaptor that converts the 15-pin connector to the more standard 23-pin Amiga RGB plug.

The picture quality is very good, especially when compared to the old single-scan 1084 monitor, but the unit we tested did have a few problems - the tube displayed disturbing signs of purity problems, "pin cushioning" (where the edges of the screen warp, rather than being perfect rectangles) and convergence errors, which become particularly bad in high-resolution mode because the smaller pixels reveal more colour "ghosting". This was probably just a fault in the test unit, and if so, the 1942 is a good option. However,

000000000 SHOPPING LIST

Commodore 1942 monitor£399 By: Commodore UK Available from: Silica Systems, 1-4 The Mews, Hatherley Road, Sidcup, Kent DA14 4DX **=** 081 309 1111

rumour has it that Philips are soon to release a successor to the brilliant CM8833 that will be able to handle AGA modes, and it may be worth waiting to compare this with that before parting with your readies. Jason Holborn

CHECKOUT COMMODORE 1942 MONITOR

Build Quality

As well-designed and solidly built as you'd expect a Commodore monitor to be, with a reliable Philips tube.

Picture Quality

Very good when compared to a conventional single-scan monitor, but not quite up to the same standards as leading multisyncs.

Documentation

0000000

The manual tells you how to set the monitor up but little else. Some form of pin-out diagram would have been nice.

Value for Money

00000

May seem cheap when compared to the original 1084, but there are other (and better) multisyncs available for the same price.

Overall rating

0000 Unless you're a Commodore stalwart, it may be wise to check the competition particularly Philips's soon-to-be-released successor to the CM8833.

Nexus Backdro

ix sets of disks full of copyright-free images, each set costing £29.99 that's Videoworld

Multimedia's Nexus Pro Background Sets. Available in two flavours, AGA and "Pre-AGA", the whole collection contains around 140 images derived from digitised photos, real-world objects and slides. I saw a review set including a "representative"

cross-section of images.

This one's "Satin"; there's another you can check on the cover disk.

Textures, Travel and Weddings/ Romantic, with the sixth set being an introductory "Sampler" set consisting of the "Best Of" the five full sets.

The AGA variations are mainly 704 x 566, 256-colour or HAM-8 images and boy do they eat up disk space. Most of the demo images were well over 300K in size. some even as large as 400K. which goes some way to explaining

why the AGA sets have ten disks per set to the Pre-AGA's seven, even though the Pre-AGA sets actually contain more images. If you want to get at them fast (for instance while running a live desktop video presentation) you'll definitely need to save them to a hard drive. I'd also think some extra memory would come in very handy if you're using an A1200 with the HAM-8 images.

The Pre-AGA images are mostly 16-colour 704 x 566 images - again overscanned, but of course with not guite as much colour as their AGA counterparts. The obvious result is that the non-AGA files are smaller,

but with much of the original colour inevitably lost. However, I'm pretty sure that this won't bother non-AGA Amiga owners, especially if they are familiar with the excellent 16-colour backgrounds supplied with

Some examples of the Nexus Pro backgrounds. This one is "floor" ...

CHECKOUT **NEXUS PRO** BACKGROUNDS

Documentation

No printed documentation supplied with

review set, but I didn't need any to use the images and a Readme file told me all I needed to know.

Ease of Use

Use your favourite paint, presentation or image-viewing program, so long as it can handle the picture formats.

Value for Money

Plenty of pictures for the pound, though of course the value depends on whether

you're likely to use all the images.

Overall rating

From what I've seen these pictures look excellent, though I'd have preferred them to be delivered in 24-bit JPEG format as standard, not at extra cost.

V sets may be cheaper, but on a monitor the difference in picture quality is really enormous - especially with a multisync such as this, though you can't plug it into any Amiga except an A3000 without a

CHECKOUT MICROVITEC MONITOR

Features

Above average for a multisync.

Documentation

•000000 Technically precise but irrelevant to Amiga users.

Ease of Use

Set it, forget it.

Performance

One of the best sub-£500 tubes I've seen, plus NTSC and PC compatibility.

Value for Money

0000

Worth it, but not by a lot.

Overall rating

A good display, but just out of most people's price league.

Microvitec multisync monitor

Commodore Interface (£20 from First Choice), which plugs into the 23-pin video connector and gives a standard 15-pin S-VGA output.

The 9-pin multisync cable supplied, although not an Amiga standard, should connect to most deinterlacer ("flicker fixer") units and also some 24 bit display cards like the Image Engine (see page 20). You don't actually need a deinterlacer though - the monitor scans the incoming video signal, be it 15 or 31KHz, and synchronizes the picture automatically so that it doesn't jump.

The monitor has a universal power supply to use US voltage, and can take NTSC Amiga output as well as PAL. It can automatically detect IBM PC CGA/EGA TTL input and switch to the different standard, though this is redundant for Amigas.

The screen display warms up

0000000 SHOPPING LIST

Microvitec Multisync£410 From: First Choice, Unit 3, Armley Park Court, Off Cecil Street, Stanningley Road, Leeds LS12 2AE ☎ 0532 319444

quickly and is very good compared to similar ,28-inch matrix tubes, Colours were noticeably crisper than my aging CBM 1950 multisync, with great luminescence (brightness). Edges were sharp, and low black levels produced acceptable shadows.

You don't select image size or adjust positioning with a simple knob. Instead, four buttons are used to change the setting, adjust the

position and store the final tweak. It's nice to see a programmable monitor, but I would prefer to be able to store a range of different settings for use with different displays. One less useful feature is that the power light changes from green to amber when the monitor is receiving what it thinks is a sync signal.

Rather than sporting the pathetic loudspeakers found in cheaper monitors. this one has no

sound at all, so you'll have to plug in your hi-fi system. Fair enough; the Amiga sounds better when run through decent amps anyway.

This is an expensive monitor, but if you are a globe-trotting serious Amiga graphics user and you need to differentiate between every single pixel on-screen, it could be a worthwhile investment.

Pat McDonald

Microvitec's multisync monitor: a steady picture, even If you go to the US or hook it up to a PC, if you must.

Paint, a new addition to the world of Amiga paint programs, offers most of the usual features, and then some. Possibly its strongest point is full ARexx support, meaning you can use ARexx to control its functions for you, from scrolling text to animations or writing a CAD

CHECKOUT RPAINT

Features

ARexx and AmigaDOS support -

brilliant! And most of the standard art package functions are there. Somewhere.

Documentation

Full, but heavy! Keep your Jargon Busting columns handy.

Ease of Use

Okay if you know ARexx or can learn keyboard shortcuts very quickly. Otherwise slow and tedious continually pulling down menus.

Value for Money

•00000 Depends what you want. I want features I can use.

Overall rating

Shame, it could have been outstanding.

package running under the RPaint umbrella. You can also control RPaint direct from AmigaDOS.

There are huge capabilities in screen size, from 320 x 200 right up to 16,368 x 16,384, as well as the option of a palette ranging from two to 64 colours. HAM however is not supported. A "Doodle mode" enables you to mess around while the old 68000 processor is tied up making time-consuming calculations, and two bitmaps give you the DPaint "Spare/ Main screen" option. Overscan is supported in all the working modes, and you can create icons for any of the pictures, brushes or palette files you might care to make.

Unlike other art packages, RPaint does not have a collection of tools either drawn down the side of the screen or in a sub-menu. Instead, the generation of all drawn shapes, fills, brushes, and all the rest is done by pull-down menus:

- · Project handles the usual disk and file loading and saving controls, as well as Info and Print.
- . Tools is the main drawing and

000000000 SHOPPING LIST RPaint£52.25 From: MegageM, 1903 Adria, Santa Maria, CA 93454, USA

☎ 0101 805 349 1104

image-generating menu, with options for geometric solid and hollow forms, as well as text importing, brush creation, fills and grid overlays.

 Environment allows movement between screens, plus colour control, pattern fills and grid alterations.

All options on the menus have the expected keyboard short-cuts, but learning a whole set of routines is time-consuming, and the absence of on-screen icons makes using the program very slow. I found myself growing impatient with having to move to the menus all the time.

RPaint does grow on you, but it doesn't really stand up well to the inevitable comparison with DPaint. It has many of DPaint's features. but they're harder to use and harder to get at. Automating them with ARexx is fine, but you have to work them out in the first place, and in any case the average user will want to just use the program, not bother with scripts

and such. The whole package is not intended for the beginner, and the manual reflects this, being written in unfriendly and technical jargon.

It will take you longer to familiarise yourself with RPaint than most art packages, and the drawing and painting capabilities, which is what an art program should be all about, remain hard to use without icons or colour menus. As it is, and despite the excellent ARexx support, the usefulness of this program as a paint package is limited.

Wilf Rees

RPaint's features - most are analogous to DPaint's. There are keyboard shortcuts for most, but learning them is time-consuming and there are no icons to help.

RO PAGE V4 & Pro Draw 1 NEW ... THE PUBLISHER OTP BOW PRICE

Wordworth v2 AGA

he new version of Digita's high-end word processor Wordworth v2 AGA is exactly the same as Wordworth v2, the only differences being added support for 256-colour custom screens, plus DbIPAL, Super72 and Super High-Res Interlaced. HAM-8 graphics are also now supported, plus 256-colour ILBMs and PCX files.

Wordworth's specialist area is printer font support. It is the only WYSIWYG Amiga word processor that will enable you to swap printer fonts

Project Edit Formul Document United Wordworth First and replace. 239 And the Party of t Go to. ----Spolling checket... User dictionary. Provided you have the memory and the time (and a fast Amiga), Wordworth v2AGA will enable you to include 256-colour pictures in your documents.

mid-document, mid-line, or even midword if you must. You can also use some of the fonts built into various printers, which means faster printing, but these are not scalable, so you are stuck with certain sizes, usually 10pt and 12pt, which are dictated by the printer. Not all the fonts in every printer are supported, so check with Digita before shelling out.

For greater font flexibility, you can use Compugraphic outline fonts. Wordworth v2 AGA comes with 17 of them, and plenty more are available commercially and on PD disks. Their

> disadvantage is that everything is printed as graphics, which considerably slows down printing times. PostScript printing is supported in mono only, and Wordworth comes with screen fonts for the classic 35 typefaces found in most PostScript printers. There is no facility to use or download PostScript soft fonts.

Of all Amiga word processors, Wordworth currently has the most features and the best all-round printer support, qualities that are reflected in its price. It has a pleasant user-interface that isn't too difficult to learn, thanks to the excellent manual, and in a sensible word-processing screen mode it runs as quickly as any other WP. However, running it in even 16 colours slows it down badly on anything but an Amiga 4000, almost unusably so. In 256 colours, even on an A4000/040. Wordworth v2 AGA is so slow that I can't imagine anyone living with it.

Weighing price against features and performance, Wordworth v2 AGA is certainly the best word processor on the Amiga. But compared to the top Windows™ word processors WordPerfect and Microsoft Word on the PC, which cost about the same. Wordworth looks very ordinary indeed. Wordworth 3 is just around the corner and great improvements are expected, so watch this space. Jeff Walker

CHECKOUT Wordworth v2 AGA

Features

More features than any other Amiga

word processor, but way behind what word processors on other platforms are offering.

Documentation

A good manual, slightly spoilt by the

lack of a beginners' "how to" section.

Ease of Use

Intuitive interface, but getting the printout you expect can be difficult for beginners.

Speed

Yawn in anything but two or four

colours.

Value for Money

In today's marketplace, underpowered and overpriced.

Overall rating

The best current Amiga WP, but Wordworth is rapidly falling behind the times. A version 3 to match the likes of Word for Windows is needed.

CygnusEd Professional

programs have stayed the course, but CygnusEd Professional, better known as simply Ced, is one of them. It was launched about six years ago when Kickstart 1.2 was still the new kid in town. And even then it supported a weird thing called ARexx, which - I quote from a review of the time - "apparently has the ability to interface with other programs". Sends shivers down my spine, that does.

ot many Amiga

Ced is not a word processor, it is

a text editor. You can process words with it, of course, but Ced's main calling in life is not to prepare and format text ready for printing, it is essentially for writing and developing programming language source code, be it in C, assembler, Pascal, ARexx, AmigaDOS or whatever. Most of the features are biased towards helping the Amiga programmer produce and maintain code more quickly, like the unbeatably fast search and replace facility. On an A4000/040 Ced can replace 100,000 occurrences of one character with another character in a

> 1Mb file in about 10 seconds - that's 10,000 finds and 10,000 replaces every second. Obviously it's not so quick on the slower Amigas, but even on a straight A500 the average search and replace task is over before you blink.

There's more to text editing than search and replace, of course, and Ced has just about every feature that a programmer could

want from a text editor, including comprehensive macro and ARexx support. Heck, if you are a C programmer you can even send commands to Ced straight from your C program rather than having to go through ARexx.

Up to 30 Ced windows can be opened, each with a different file, or each showing a different view of the same file. Simple word wrap and formatting features enable you to use Ced as a rudimentary word processor, and indeed most shareware programmers bash out their manuals in Ced, which accounts for the carriage returns at the end of every line instead of at the end of every paragraph, which is what a word processor would do.

It would be unfair to call Ced the ultimate Amiga text editor because there are a growing number of programmers using Oxxi's rival Turbotext package these days. But Ced has stayed the test of time and

has a pedigree second to none. Jeff Walker

CHECKOUT CYGNUSED PROFESSIONAL 3.5

Features

Contains more features than you'll

probably ever use.

240 pages, half of which is dedicated to controlling Ced via ARexx.

Ease of Use

learn all of them.

Documentation

You hit a key, a letter appears on the screen. But thanks to the sheer number of commands, it'll take a while longer to

Speed

The speed of its search and replace feature is phenomenal.

Value for Money

A bit pricey compared to average non-WYSIWYG word processor prices.

Overall rating

A million Amiga programmers over six years can't be wrong.

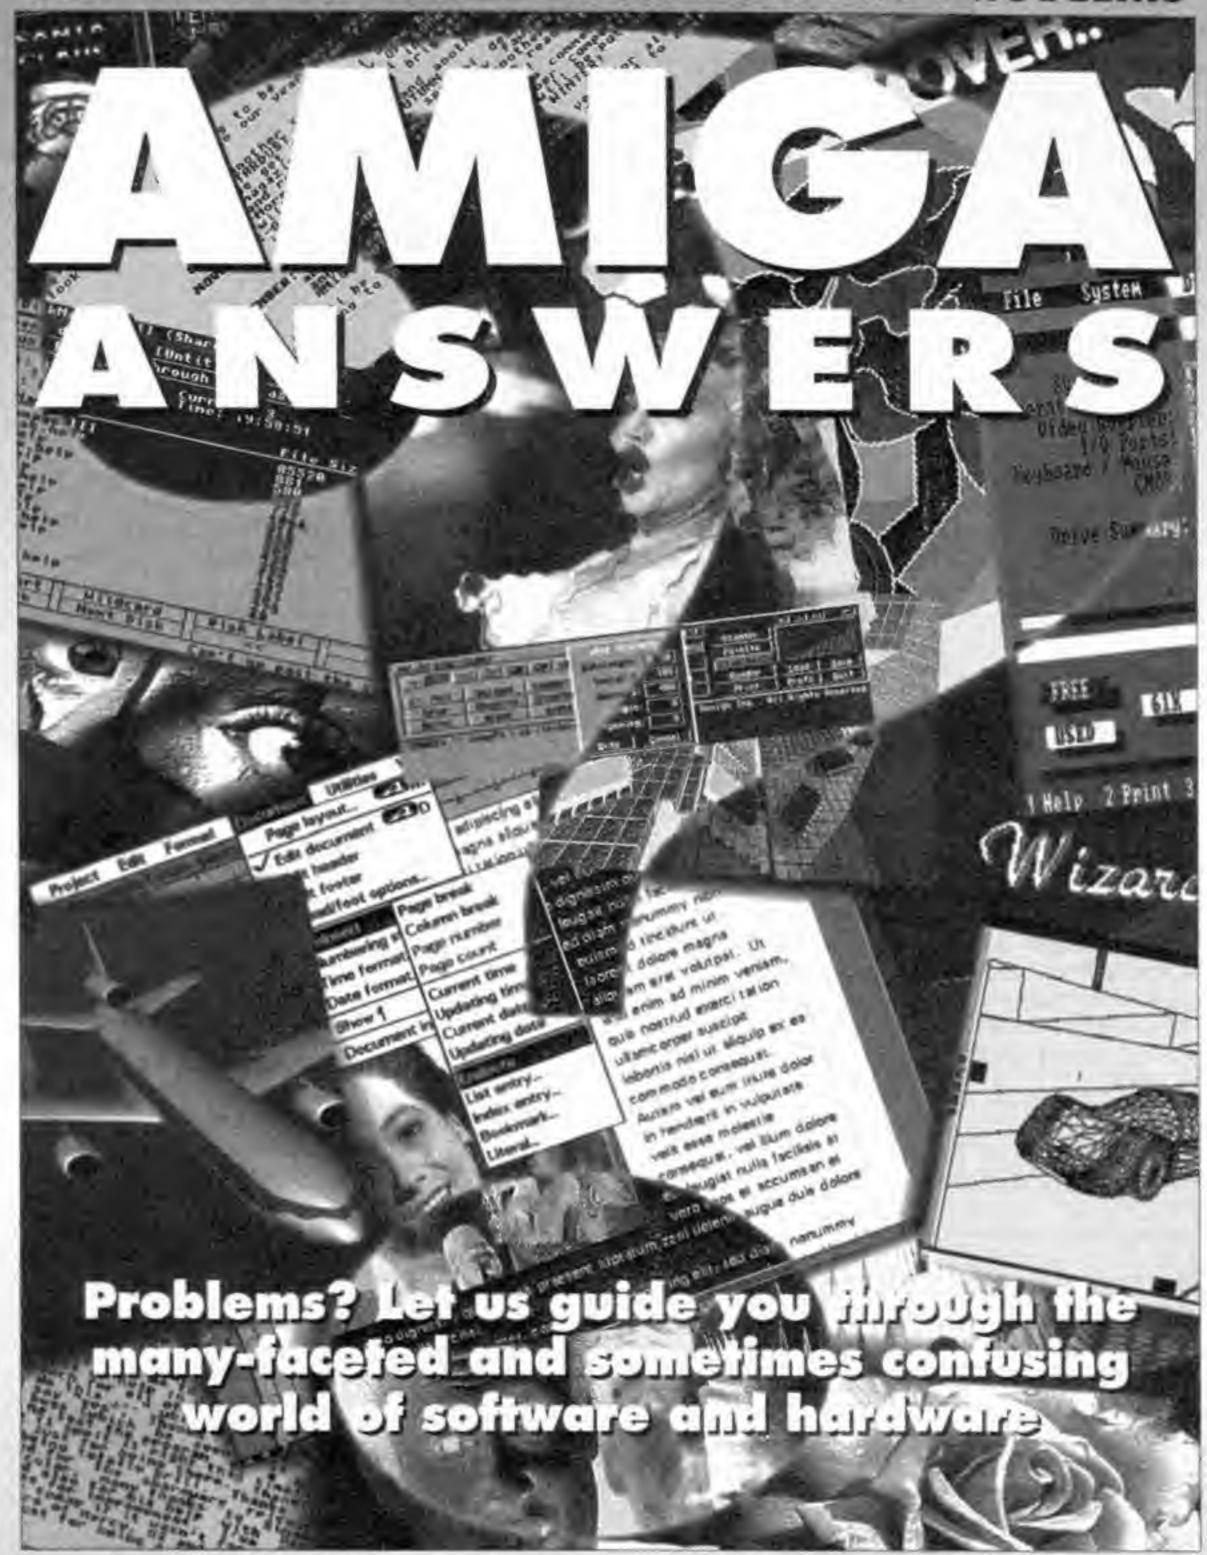

CygnusEd Professional's comprehensive Undo and Redo levels make it easy to step quickly backwards and forwards through a text editing work session.

Queries

If your question relates to comms, including

modem problems, this is the icon we'll use.

NO PROBLEMS

ello and welcome to our magazine within a magazine - the place where we endeavour to solve all of your Amiga-related problems. We'll deal with any sort of problem, no matter how trivial or complex, no matter what aspect of the Amiga it involves. We devote more space than any other magazine to this service, and we use icons extensively to make sure you can find your way around the pages as easily as possible, and find the solutions to the problems you have. Our use of Jargon-busting boxes ensures that you'll be given explanations for any unfamiliar terms. We also try to put the problems in as wide a context as possible, so that their solutions will benefit not just the person who has written in, but all of you with related problems. So even if you haven't sent a problem in for answering, it's worth having a look through these pages to see if someone else has asked a similar question. The index on the previous page will give you a guide to the topics covered this month.

We draw on the services of a talented team of Amiga enthusiasts, all of whom are widely regarded as experts in their fields. Mark Smiddy is our AmigaDOS and floppy drive expert. Jeff Walker is our desktop publishing, fonts and printer correspondent. Then there's Gary Whiteley, an expert on video applications and graphics. Jason Holborn has mastered the introcacles of AMOS, and with his advice you'll be able to do likewise.

Jason also has an encyclopedic knowledge of what's available in the PD world. If you have a query about comms then we'll set recent star of the small screen Dave Winder on the case. Toby Simpson is our expert code clinician. If you're experiencing problems with anything from C to assembler, try taxing his little grey cells instead. You'll find his special Cade Clinic section - in which he removes the bugs from your programs - on page 46. Wilf Rees is a man with an education well, an expert on educational software, at least. He's also got a jolly useful all-round knowledge of Amiga hardware and software. Last but by no means least is Jolyon Ralph - he also knows lots about hardware, and specialises in hard drives and CO-ROM systems.

So that's our batch of boffins it's up to you to keep them busy. They thrive on your problems, so be sure to send them in. Remember, it. doesn't matter how simple or complex they are - everyone has to start somewhere, so beginners shouldn't be afraid of asking for help, and even the most experienced Amiga user can get stuck occasionally. And if you've got any tips or hints to share with your fellow readers, then send them to us and you could soon be a tenner richer. Please mark the envelope "Tips" and send them to the Amiga Answers address specified on the form below.

Please don't include an SAE with your questions – we simply receive too much mail to be able to offer a personal reply service.

f you send in a question for the Amiga Answers experts, please fill Hard disk: Mb as DH_: Manufacturer in and include the form below (or a photocopy if you don't want to Extra RAM fitted - type, size in Mb and manufacturer cut up your magazine). And please also make sure that you include all the relevant details - version numbers of software and so on so that we have the best chance of helping you. Details of any other hardware which could help us to answer your question: Send your form and question to: Amiga Answers, Amiga Shopper, 30 Monmouth Street, Bath, Avon BA1 2BW. Sorry, but we cannot reply personally to any questions - even if you include an SAE. Name: Address: Now, use this space to describe your problem, including as much relevant information as possible. Please continue on a separate sheet if necessary. ANYONE FOR T?

I recently bought an A1200. Upon loading many of my old "selfmade" disks, such as my database and so

on, I get an error window telling me to "insert volume T". When I click on cancel, the program loads as normal. Just what is "T"?

Also, I've noticed that when I insert a disk into the drive it takes a few seconds before it starts to read the disk, whereas my old Amiga (Workbench 1.3) started almost immediately. Do I have a problem or is it the same with all A1200s? Chris Wright Radcliffe Manchester

In AmigaDOS 3.0, when some Shell commands are executed, a temporary file in an assign called "T:" is created. Normally, the computer would look at the RAM disk to find the directory "T". In your case, it cannot find this drawer and is unable to write a temporary file. Although this error will not usually affect the running of a program, it can be quite annoying, so add these lines to near the start of the Startupsequence of your self-made disks.

makedir ram:t assign t: ram:t

Once this is done, your Amiga will know that the T: drawer is located in RAM:t.

Regarding the time lag between your inserting a disk and the computer reading the disk, you do not have a problem. Depending on how busy the CPU is at the time you insert a disk, the read times for the disk drive may vary. WR

OPEN THE TRAPDOOR

I've just installed Trapdoor and Point Manager on my hard disk. They seem to work okay, but when I

phone my Boss I get connected and then Trapdoor closes down without getting any messages. How do I tell It what messages to pick up and where from?

John Sparks Wellington Somerset

The problem is that you haven't yet told the software at your Boss what areas you are interested in, and to do this you need to use AreaFix. Basically when you want to join an echo you send a message to an AreaFix robot running on the BBS in question, and in order for the message to be processed you need to agree an AreaFix password with

the SysOp, so give him a call.

Using the AMIGA_UK echo as an example, construct a netmail message with a body text of

+AMIGA_UK

and send it using Point Manager and Trapdoor to your Boss with a subject of <password> and address of AreaFix. The AreaFix running at your Boss will then process this and join you to the echos, and messages will be picked up next session.

So assuming your AreaFix password is "wibble", the netmail would look like this:

TO: AreaFix SUBJECT: wibble +AMIGA UK

If you want to join several echos at once then the netmail should look like this:

TO: AreaFix SUBJECT: wibble +AMIGA UK +WORKBENCH +AMIGA DTP -COMMS

Many thanks to Fidonet guru and all round nice guy lan Moran for his expert advice. DW

BLACK PAGES

PRINTERS

Scribble! didn't work very well with my Canon BJ-10ex printer, but with help from Canon we discovered

by trial and error that it could be made to work as long as the Workbench 2 disk used with it had a USA keymap, and as long as the BJ-10ex was used in Epson LQ mode.

This wasn't very satisfactory, so I bought Wordworth 2. Since February Digita have provided me with two replacement disk packs, but the system will still not print outline fonts; it will only work with internal printer fonts. If I try to use outline fonts my BJ-10ex will only

print a solid black block, even if on the screen just one character is displayed.

I recall there has been a history of difficulties with printer drivers associated with Canon BJ printers. Canon were most helpful and sent a disk with an appropriate driver for the Scribble! program. Digita's Wordworth comes with its own Canon BJ driver, but is this a valid driver? If it would be better to install Canon's own driver to make Wordworth function properly, can you explain how this should be done?

A Sanders Hempstead Essex

Huh? What history of Canon BJ printer driver problems? The truth is the complete opposite. Canon UK were sensible enough to commission the development of a disk of Amiga printer drivers, thus making Canon bubble jets one of the most compatible printers you can buy for use with your Amiga. That disk is what I assume Canon sent you, although it has been updated a couple of times since February, so perhaps you don't have the latest version.

To install the correct Canon driver for the BJ-10ex, simply run the installation program on the Canon drivers disk and answer the few questions it poses (like what printer have you got). It's an absolute doddle. The Canon driver is a much later version of the driver distributed by Digita on the Wordworth disk they asked for and got permission from Canon to include it on the Wordworth disk.

The last time this "solid black block" cropped up it was with Professional Page and it was solved by making sure that the Shade option in the Workbench PrinterGfx prefs program was set the same as the equivalent setting in the Professional Page print requester. So try that. And make sure the BJ-10ex

is in BJ mode, not Epson LQ mode. If you want to use the BJ-10ex in Epson LQ mode, use the EpsonQ driver that was supplied to you with Workbench. JW

AMIGA ANSWERS

SURE OF SHELL

1. I have a number of programs that require an "assignment" to be made in order to work correctly from my hard

drive. The manuals bundled with these packages say that I should place these assignments into my "S" directory. When I type the assignments in using the Shell "Edit" command and reboot, the programs still try to access the disks they came from. Please tell me exactly how to save my assign statements in such a way that they are automatically carried out whenever my hard drive boots up. 2. I have an XT bridgeboard fitted to my machine. It would be nice if I could use the 5.25-inch drive to run some C64 software. I have an emulator but it only operates on the 3.5-inch drives. Is there any way to make the emulator acknowledge the existance of the XT bridgeboard drive? This drive was fitted at the time I purchased my machine. 3. Finally, I have read in Amiga Shopper that it is wise to have a virus killer running at all times. How do I insert the virus killer into my startup-sequence so that it is always running when the machine is booted up? Charles Hooker Stroud Gloucestershire

1. It sounds to me as if you're not entering the assignments into the correct file. If the manuals are simply stating that the assignments should be placed into the "S" directory, then this is a little misleading. They should in actual fact be entered into your "StartUp-Sequence" file, which itself is in the "S" directory. Simply enter this line at the Shell prompt:

Ed S:StartUp-Sequence

Then enter your assignments somewhere within the startupsequence and with a little bit of luck it should work.

2. Unfortunately there's no way to get the disk drive connected to your XT bridgeboard to read C64 disks, simply because C64 disk drives have their "DOS" (disk operating system) built into their firmware - that is, in ROM. In order to read C64 disks. you'll need to buy a special adaptor produced by the emulator manufactuer which will enable you to connect a real C64 disk drive to the Amiga.

3. If you're using a program like John

JARGON BUSTING

BBS - Bulletin Board System. The name comes from the American College bulletin board (the cork and drawing pins type) which is a traditional meeting and trading place.

FIDONET - a system enabling many bulletin boards to be connected together so that messages can be transfered bewteen them.

Startup-sequence - A program

which is executed every time the Amiga is switched on and after every reset. It sets up the system so that it is usable from Workbench, and may be customised by those who have unusual requirements.

SysOp - System Operator - the person who sets up and controls a bulletin board.

Trapdoor/Point Manager -Specialised FIDONET software.

Veldthuis' Virus Checker (successive revisions have been on the Amiga Shopper cover disk a number of times in the past), the easiest way of "installing" it is to simply copy it into the WBStartUp drawer on your hard disk boot drive. JH

BETTER SOFTWARE REQUIRED

When I'm using my Amiga 1200 and the Citizen Print Manager software with my Star PRINTERS LC24-200 printer, the

software gives a recoverable alert. If, after recovering, I try to print, the machine gives a software failure after printing one page. I have also tried Turboprint and this does the same thing.

E Hayes Blackburn Lancs

Obviously Citizen Print Manager and Turboprint, two programs (from the same German developers) that "patch" the operating system, are not completely compatible with Workbench 3. Your best bet is to get hold of CanonStudio (from JAM on 0895 274449). Although this software was written for Canon bubble jets, because Canon bubble

jets are Epson compatible, the CanonStudio "BJ-EC" driver also works with Epson compatible 24-pin printers like those made by Star and Citizen. (The "EC" in the driver's name stands for Epson Compatible.) All the CanonStudio drivers and preferences programs are perfectly stable under Workbench 3. In fact you need at least Workbench 2 to use it. JW

STRINGING ALONG

I'm trying to learn C. I have got DICE from Fred Fish Disk 491, and Mastering Amiga C by Paul Overaa. My

problem is that I can't assign strings to char arrays. I've tried examples from Mastering Amiga C. DICE consistently refuses to compile these. Do I need to register DICE to get this feature, or am I being really stupid? David Lambert Garrowhill Glasgow

No, you've simply found one of the features not implemented in DICE yet. I've tried this using DICE version 2.06.21 several times in different ways without luck. It was something Matt Dillon (the author of DICE) was

intending to do in a future version, and may yet do - he is currently working on a commercial version of DICE. SAS C 6.3 will do string assignments of the type you were trying (all as one line, of course):

char test_string[20] = "Hello " world!";

DICE will not compile this, as you have discovered.

Don't despair though - this will work (the means no line break):

#include <stdlib.b>

char test_string[20];

stropy(test string, "Hello " World!");

If you want to explore DICE some more, get hold of the new book, Complete Amiga C, published by Future Publishing and written by Amiga Shopper's own editor, Cliff Ramshaw. (You've had a taste of it in the introductory book free with this issue.) As well as covering more of the C language, it comes with the enhanced full version of DICE, which offers extra features (including the ability to do floating point maths). plus various extra utilities and documentation. It is available from

good bookshops, or you can order direct - see page 74. TS

IN FROM THE COLD

When I'm importing clip art into PageSetter 3, the program happily imports ProDraw clips into an active box but

refuses to load any clip art from the Graphics Editor, which is supposed to be hotlinked. It won't import directly either. I clip what I want and then use it as my brush, but then what? I've tried saving and quitting, as it says in the manual, but the active box in PageSetter 3 remains empty. I am using an Amiga 500 Plus with Kickstart 1.3 and Workbench 2. I have 2Mb of memory in all. **Gary Brunskill** Sutton Lancs

First, using Kickstart 1.3 and Workbench 2 together is a pretty silly thing to do, a bit like adding Modeo wheels to an Escort chassis. Either return to using Workbench 1.3.2, or upgrade your Kickstart to the Kickstart 2 ROM.

Right. PageSetter 3. I know that the hotlink works, but I've just tried it continued on page 45

I am programming a little text editor in C, which needs to work only on Amigas with Kickstart 2.04 and upwards. I would like to have a scrollbar with arrows. The scrollbar

should be located in the right border, and should look like the scrollbars in Workbench windows. How do I do it? It is easy to make a scrollbar with arrows when you are using GadTools library, but you can't put it in the border, and it does not look like the one on the Workbench windows. The only way to do this is to use Intuition's old gadget routines, which makes the scrollbar look right, but how about the arrows? I could, of course, do my own custom gadgets emulating the arrows, but they are different in Workbench 2.0 and 3.0. I would like to have arrows which look right on both systems. I know that it is possible, because the text editor of DevPac 3 uses the right kind of arrows on both systems. Janne Pietarlia

Espoo Finland

This is a tricky one, and I remember being baffled by it myself only recently. The solution is to use BOOPSI gadgets. BOOPSI stands for Basic Object Orientated Programming System for Intuition. Using BOOPSI, you can clone the built-in proportional and arrow class gadgets and use them for yourself, which is precisely what both Workbench and DevPac do. It's quite complex, and I'd certainly recommend that you read the

section on BOOPSI in the ROM Kernel Manual on Libraries and Devices, published by Addison-Wesley and availble from any good computer bookshop (ISBN 0-201-11078-4).

Here is a small example of the definition for a scrollbar gadget that will fit in the right hand border of your window. You'll need to patch it into a full program with Includes, but this should at least get you going. You can also create images from BOOPSI, which is where you get your standard arrow buttons from. TS

Protext 6 - A Winning Performance

Some highlights of Protext 6

Styles

Styles let you make flexible use of printer fonts and effects. You can change a font throughout a document with a single operation.

Graphics

Graphic images may be imported into a Protext document. Supports IMG, PCX, GIF and IFF. You can select any resolution and scale the image. Dot matrix, inkjet and laser printers.

Document Layout

An easy to use dialogue lets you lay out your page precisely as you want using inches or cm for the page length, margins and tabs.

Printers

Protext's unrivalled understanding of printers gives you the highest quality printing at the highest possible speed. Using a printer's built in fonts enables Protext to print pages in seconds rather than the minutes taken by some programs.

Protext is still the fastest

- Fastest at editing.
- Fastest at spell checking.
 - Fastest at printing.

Protext still has the best printer support

- Hundreds of printers supported
- PostScript driver included NEW
 - Scalable font support NEW
 - Colour printing NEW
- Automatic line spacing NEW

Protext still has the most advanced features including:

- Styles NEW
- Graphics import NEW
 - Spelling checker
 - Thesaurus
 - Hyphenation
 - Document analysis
 - Glossary NEW
 - Footnotes
- Widows and orphans
- Index and contents
- Addition of numbers
 - File sorting
 - Mail merge
- Programming language
 - Macro editor NEW
 - Dictionary editor NEW

WorkBench New Look

- New WB menus, requesters, gadgets
- Screen requester to select mode NEW
 - ARexx interface NEW

The list price of Protext 6 is £152.75 but you can order direct today for just £99 inclusive. For any Amiga with 1Mb memory and WB 2.0 or later. Phone us today and we will send you a usable demoversion and a full specification, absolutely free. Upgrade offers available - please call us for the current price.

MULTIFACE CARD 3

Multi I/O card for Amiga 2000/3000/4000; 2 additional serial ports and 1 parallel port. £149

GIGAMEM

Virtual memory management for all Amiga with MMU. Including 040 support.....£59

Most recent powerful applications for the Amiga (eg: for graphics, music, animation, raytracing, D.T.P.) require more main memory than is available or possible to integrate. GigaMem is a program which simulates up to 1 GigaByte memory, which swaps onto any mass storage system (i.e. hard disk). Intelligent management accomplishes simultaneous use of several programs in a multitasking mode.

System requirements:-

- * GigaMem works with all AMIGA <R> computers with MMU (Memory Management Unit): i.e. Amiga's with 68020 or 68030 accelerator and MMU.
- * No restriction on type of HD controller and hard disk.
- * GigaMem is compatible with Kickstart 1.2/1.3 and 2.8.

TRUEPAINT

24 Bit paint program for all Amigas; also AA

Paint Program for Amiga Application: TruePaint is a professional 24 bit paint software with full suppport of the AA chipset Amiga line. Using TruePaint, Amiga graphic and 24 bit graphic can be edited without any loss of quality. A maximum of 16368 x 16368 pixels renders your graphics feasible even for slide development systems.

FEATURES:

- ★ Up to 16368 x 16368 pixel with oversize function.
- ★ Various draw and paint functions.
 ★ Functions for mask, outline, recolor and filling.
- * Airbrush with adjustable spray functions and stipples.
- ★ Transparence curves also by brushes.
 ★ Slant, rotate, scale.
- * Easy drawing of Bezier curves.
- * Lightable function for editing animation pictures.

 *Text functions with full support of Bitmap and Compugraphic fonts.
- Load and save with different formats: IFF, ILBM, PPM (Unix), IPEG and TruePaint special format.

 * Quick View of pictures with MINIPIC function.

 * Any Macro functions can be assigned to 20 function keys.

 * Unlimited Undo/Redo including Macros.
- * Full AREXX support.

SYSTEM REQUIREMENTS:

- * All Amiga with AA chipset, e.g. Amiga 1200/4000.
- ★ Kickstart™ 3.0 or above.
 ★ Minimum 2Mb graphics memory.
 ★ Additional memory recommended.

Repair service

New service centre/repair for most Amiga computers. We offer a quotation service of £10 for which we will examine your computer and report back with an exact quotation price for the repair. If the repair is carried out the £10 is then deducted from your bill.

ATTENTION! COMMODORE & AMIGA END USERS & DEALERS

TOPSELLER ADVANCED AMIGA ANALYSER

AN INEXPENSIVE DIAGNOSTIC ANALYSER THAT WORKS ON ALL AMIGAS

Amiga Shopper UK magazine says "Without doubt, this is the finest diagnostic equipment I have ever seen, and I address all Amiga repairers and practical-minded users when I say this is really something worth having."

A complete diagnostic hardware and software analyser (uses point and click software interface). The analyser plugs into all Amiga ports simultaneously and through sophisticated software displays eight screens to work from. Shows status of data transmission/signals: tests game port function, parallel port, serial port, disk drive, video ports, memory (buffer) checker, system configuration and auto test. Reads diagnostic status of any read/write errors from track 0 to track 79. Software automatically tells what errors are found and chips responsible. 85% to 90% of the problems presented to service centres are found with this analyser. Saves you lots of money on repairs and no end user or repair shop can afford to be without one. Don't be fooled by its low cost. Simply plug in cables from the analyser box. This sophisticated tool is used by end users and Amiga repair centres

again anyway and PageSetter 3 and the Graphics Editor work together just as described in the manual. Import a bitmap into a box in PageSetter 3, send it to the Graphics Editor, make your changes or cut out your brush or whatever, then save it, ensuring that you use the same filename as the original bitmap. When you Quit from the Graphics Editor the bitmap you just saved will be automatically re-imported into PageSetter 3, although you'll probably have to adjust the scaling again. If you saved the bitmap from the Graphics Editor under a different filename from the original bitmap filename (the one you imported into PageSetter 3), then the hotlink will

not work.

Keep in mind that the amount of memory you have is the bare minimum for the graphics and text hotlinks to work, so some failures could be due to lack of RAM. JW

SCAN AND DELIVER!

I currently own an A500 which I use mainly for DTP, paint programs and other serious software. I feel

that to use these programs to their full potential, it would be wise to upgrade to an A1200 - I was thinking of the "Desktop Dynamite" pack with 40Mb hard drive. However, some of my present hardware plugs into the expansion bus which has been replaced by the

PCMCIA slot on the A1200. This hardware includes a Naksha hand scanner and an Action Replay Mk III cartridge. I understand that it may be impossible to use the Action Replay cartridge on the A1200, but is there anything I can do about the scanner?

R J Mooney Ramsey

Very few hand scanner manufacturers actually build their own scanner "heads" (the bit you hold in your hand when you scan an image). Naksha, for example, use exactly the same scanning head as Power Computing - the only difference between them is the interface that connects that scanner head to your Amiga and the software

that drives the scanner. It's therefore possible to use your scanner on an A1200 simply by upgrading the interface and software that you use with it. Power Computing sell the interface and the latest version 3.0 of their scanner software as a separate item for just £49.95. Power can be contacted on 0234 843388. For details of the range of Amigacompatible colour scanners, see last issue's cover feature. (Amiga Shopper 32 is available on page 106 if you missed it.) JH

A friend has translated some video stills from his video recorder via an Atari ST to disk. How can I translate

A SMALL PROBLEM OF COMMUNICATION

THE FIRST STEPS

COMMS

I've purchased a modem from a friend at a bargain price, but now I really don't know what to do. How do I

actually use the thing to get access to a bulletin board? In past issues of Amiga Shopper you've mentioned different "terminal" programs, which you say are available for download from most good bulletin boards, but

how do you get connected in the first place to get them? Dr Lawnes Ryde Isle of Wight

Comms can seem very confusing at first, especially when you've got a modem and no idea what to do next! Let's walk through it a step at a time.

Terminal software enables your Amiga and modem to talk to each other. Of course if you haven't got any yet you can't get on-line to a BBS to get any, so the answer is to purchase the program from your local Public Domain library - see page 120 for a directory of these.

I would recommend one of two programs. The first is TERM, which I use myself and find both comprehensive and easy to configure. TERM is a PD program and is updated at amazingly regular intervals. The second option is NCOMM, which is a shareware program that has been around for many years and is the the tried and trusted choice for many comms

users. To learn how to install these. read the documentation that comes with them - always worth doing; It can save a lot of heartache and sleepless nights later.

Once you have installed the terminal software on your Amiga, you will need to find a BBS number to call. Check Amiga Shopper's user groups listing on page 93, flip through the adverts in this issue, or try 01-for-Amiga (@ 071 377 1358) or

If you log on to a Bulletin Board as a new user, you may well encounter a screen something like this ...

the Cheam Amiga Bulletin Board (# 081 644 8714). We've mentioned others in the comms column in past issues as well.

On calling a BBS for the first time

you will be asked to register as a new user. Don't be alarmed - it won't cost you anything (unless you are calling a commercial system like CIX), but the System Operator or SysOp needs to know a bit about the people he allows to use his system. Just follow

I'll answer the easy bit first. Either of the terminal software programs mentioned above, TERM and NCOMM, will be suitable. However, 1

It's not visually spectacular, but TERM is an easy-touse yet comprehensive comms program - and it's PD!

two. From there on you can explore the wonderful world of comms at your leisure. DW

registered as a user within a day or

the on-screen instructions, which will

guide you through the registration

you should find that you will be

PLUG IN AND GO

process. Be honest, especially with

regard to your name and details, and

I have bought a secondhand IBM modem, model 5858-01, without manual or power supply. Could

you tell me if I can get a cheap software package to run it and how much a manual and power supply would be from IBM? I have phoned both IBM and Commodore, who although helpful couldn't come up with any positive answers. Stuart Williams Whitstable Kent

information about this particular modem, so really don't know if it is going to be any good to you. The only way to find out is to try it. You should be able to get a power supply from an electronics shop - somewhere like your local Tandy would be a good bet. Take the modem along and they will be able to source a suitable power supply.

Connect the modern to your Amiga and run the terminal software. You can tell if the modern is talking to your computer and vice versa by typing in the Hayes Command "AT". which should get the response of "OK".

If that works, then try connecting to a BBS and see how you get on. Because you don't know the speeds of the modem in question, I would suggest starting off with a 2400 connect and then experimenting with higher (or lower) speeds, depending how successful you were.

Most modems these days are Hayes-compatible - that is, they conform to the standard set by Hayes modems - which makes them all fairly standard to use. If this modem is very old and not Hayes-compatible, I'm afraid you may just have bought a turkey. DW

JARGON BUSTING

BBS - Bulletin Board System. Like an electronic notice-board. only you read from it or write to it over the modem line.

Modem - Acronym for MOdulator DEModulator, An electronic device that enables your Amiga to send and receive messages over the telephone lines.

this disk information so that I can reproduce the stills for viewing on my Amiga 500? I'd also like to be able to print them out. Martin Davies Westerham Kent

There are a number of public domain programs available for the Amiga that can translate pictures stored in either ST Neochrome or Degas format to the Amiga's own IFF format. The best thing to do is to have a chat with your friendly PD supplier (see the directory of PD libraries on page 120). They will be able to point you in the direction of the correct PD disk. Better still, has your friend got a copy of DPaint for the ST? If so, then simply get him to load his pictures into this program and save them out as IFF on the ST. Then all you need to do is read the disks.

In order to read your friend's ST disks, you'll need a copy of a program called CrossDOS. This is built into the Workbench 2.1 upgrade, or if you haven't already upgraded can be bought separately. Or you could try the PD alternative, called MessyDOS. CrossDOS and MessyDOS simply enable your Amiga to read PC-format (that is, MS-DOS) disks. The ST uses a disk format that is almost identical to MS-DOS format, which these programs can

cope with - or newer STs can read genuine MS-DOS disks, which would be more reliable for this process. Using CrossDOS or MessyDOS. simply pull the images across on to your Amiga, convert them to IFF (if your friend hasn't already done so using DPaint ST) and then load them into DPaint on your Amiga. You'll then be able to print them like any other DPaint picture. JH

BLAZING AWAY AT PASCAL

I am trying to program in Pascal, but I haven't got a single book about programming it on the Amiga - I can only find

books about programming Pascal on the PC. Could you name some books?

I have heard some rumours about an Amiga 5000, with one 68060 chip as a main processor, running at a speed five times faster than the Pentium. (That's 500MHHz, so I doubt it.) It would also have two - yes, two - 68040s for handling video and sound, and 8Mb or 16Mb of graphics RAM, giving 24-bit and 32-bit graphics. It's very disappointing that this is the minimum amount of RAM to use these colours.

I have also heard about a new project between IBM and Atari. They have plans for the ultimate

multimedia machine, which would have a 64-bit RISC CPU and a stateof-the-art DSP. What do you think of these rumours? John Versnei Avon

Pascal is not a particularly popular choice of programming language on the Amiga, so I'm afraid there isn't that much in the way of choice. The best thing to do is to buy a general book on Pascal and the ROM Kernel Reference Manuals from Commodore, which explain how to program for the Amiga. HiSoft's documentation will tell you how to use Amiga specifics.

As for the A5000, I'm afraid this rumour is totally untrue. It was a hoax. One small point: to be five times faster than the Pentium (the new Intel chip, sometimes called the "586", used in the new generation of PC-compatible), the 68060 does not have to actually operate at 500MHz. It could be five times faster and be 100MHz or 50MHz. It is the actual raw processing power that is relevant, not the clock speed of the chip. The 68060 is an exceptionally well designed chip, and at 55MHz (the first version that will be available, some time early next year), it offers over three times the performance of a 25MHz 68040. which means about 50MIPS (Million Instructions Per Second), maybe a

little more. Motorola claim that they will be able to make 68060s operating at 100MHz or more, which is more than 100 MIPS - extremely fast; the equivalent of about 150 A600s.

The IBM/Atari project is no rumour: it is the Jaguar games console, designed and marketed by Atari but containing some IBM-made components. The processor is actually 16-bit - the same 68000 chip as in your Amiga - but there is also a custom 64-bit graphics processor called "Tom" and a 32-bit Digital Signal Processor called "Jerry" for the sound side of things. The Jaguar will cost £199 in this country, but it isn't the ultimate multimedia machine by a long way at least, not yet - just a games console. Its design seems to be just catching up with the custom-chipbased architecture which the Amiga has always had; we'll have to see how well it stacks up against the likes of Commodore's well-received new CD32 console. TS

PS3 WON'T PRINT

I have installed PageSetter 3 as per the on-disk instructions. I installed PRINTERS a disk of CGFonts, the

clip art on to its own disk and the CanonBJ10 driver on to the PS3Install disk (Disk 1). I loaded

CODE CLINIC CODE CLINIC CODE CLINIC

TOBY SIMPSON DEBUGS ANOTHER READER'S **PROGRAM**

Author: Program: Language: Matthew Fraser **Text Processor**

Routine produces Problem: inconsistent results and random crashes

This month we're dealing with a Crelated problem. The author runs a bulletin board, and has written himself a small utility for producing statistics on messages left on the BBS. The messages are single files. which are read into memory and then processed. The problem is that if the same message is processed twice, the program does not work. Another problem is more mysterious: occasionally, the program crashes when it is about to read in another message.

Both these problems were relatively straightforward to solve, and both are wise lessons to learn if you're programming in C. Wonderful though the language is, some types of bugs hide particularly well in it. To

find these, we first need to understand how the program works. From the command line, you can enter the number of a message to be loaded. Then typing a statistic command gets information about that message. You can then get the stats on the same message without having to re-load it, and this is where the problem lies. The first thing the statistics routine does is this:

char *text ptr, *old ptr; BOOL done = FALSE;

/* In this enippet, message V* points to the text itself */ old_ptr = message;

while (!done) text ptr = strchr * if (text_ptr) *text ptr = 0; msg_len = msg_len + V

(old ptr. '\n'): (strlen(old ptr)); if (strlen(old ptr) > Var longest line) Vo longest line = strlen(old ptr); old ptr = text_ptr + 1; else done = TRUE;

printf("len = %ld, max Vline chars = %ld\n", Vmsg_len, longest_line);

return!

Quite simply, this scans for the first new-line and replaces it with a zero. This gives us a string of the first line of the message. If this is the longest line, it is remembered, and the length of the line is added to the message total, and so forth, until there is no more message left. The catch is, if you then call this routine again without reloading the message, it shows:

len = 0, max line chars = 0

on the screen. This is because the strchr command, which searches for an occurrence means do not type L a return - keep typing & of a particular character to the end of the next in a string, can't find any \n's (newline) any more because they were all removed and replaced by 0's the first time the routine was called.

Watch out for this sort of thing. Always remember that if you're altering data in memory for a particular operation, make sure that

you aren't going to affect further operations in the future. This applies particularly for something like this, which actually processes an area of memory.

It would be possible to fix this bug very easily, by adding after the IF line the following line:

*text ptr = '\n';

The symbol -L

line. means type

the next line.

This replaces the newline character.

The next problem was slightly more difficult to track down, particularly because it did not happen every time. I eventually narrowed it down to a rather complex routine responsible for loading a group of messages into memory and remembering where they all were in a

specially designed structure. This structure held information about the total number of messages a space, then keep memory used, and a linked list of loaded and the amount of linked list of message data. The problem lay in the first line of code in the

> routine, although this was the last place I looked:

if (msg_base->messages_ -

the program and everything worked fine until I came to print. All I get is the message: "Printer driver not graphics capable". I'm stuck. Help! P Locket (computer moron) Irlams o'th Heights Lancs

The reason you get the "Printer driver not graphics capable" message is that although you have copied the CanonBJ10 driver on to the PageSetter boot disk, the "systemconfiguration" - which is the file that tells the Amiga which printer driver to load and what settings to use (among other things) - is still set to load the printer driver called "generic". To change it so that the BJ-10 driver is loaded, you need to use the Printer program in the Prefs drawer of your Workbench disk.

The best thing to do is delete the massive Clips.lzh file on the PageSetter 3 boot disk, create a drawer on that disk called Prefs, and copy the Printer and PrinterGfx programs from the Prefs drawer on the Workbench disk (or the Extras disk if it's Workbench 2.1) into the new Prefs drawer on your PageSetter 3 boot disk. Now re-boot the machine with the PageSetter 3 disk, open the Prefs drawer and run the Printer program.

Select the CanonBJ10 driver. Set Paper Type to Fanfold. Set Paper Size to Wide Tractor. Set Paper

Length (lines) to 63. Leave Left Margin (Chars) at 1. Set Right Margin (Chars) to 80. Set Print Pitch to 10-Pica, Print Spacing to 6 Ipi, Print Quality to Letter. Now Save those settings to write a new "system-configuration" file to your PageSetter 3 disk. The important settings from the PrinterGfx program can be controlled from the PageSetter 3 print requester, so you needn't worry about running that prefs program unless you want to make a certain graphics set-up permanent. JW

PUTTING THE BOOT IN

I have been working with AmigaDOS since I traded in my old A500 for a new A1200. I have managed to gain

a little understanding of bootblocks, the directory structure of an average disk and so on. The problem I have is with my new copy of DPaint IV AGA.

I followed all the instructions on how to decrunch the disk but unfortunately there doesn't seem to be a bootblock on the resulting DPaint program disk. Without the bootblock, loading DPaint is a very time-consuming task. I phoned Electronic Arts to ask them how to put a bootblock on the DPaint disk, but they told me in no uncertain terms that it was impossible. Being a bit of a stubborn chap, however, I thought I'd have a go at installing the disk with a startup-sequence myself. After a few hours I had a boot block on the main DPaint disk and a small Workbench. But although DPaint now loads fine, DPaint only allows me to use the old pre-AGA screen modes.

I think I've missed some files which I should have copied across, but I am absolutely stumped. Why did EA Insist on making DPaint only useful to hard drive owners? I can't afford such a luxury, so I'd appreciate it if you could tell me what I need to do to get my copy of DPaint to access the AGA screen modes.

Jason Hardy Sandhurst Berkshire

You were very nearly there, Jason. All you need to do to get your copy of DPaint IV AGA to recognise the AGA screen modes is to copy the drawer called Monitors that can be found in the Devs directory on your Workbench 3.0 boot disk to the Devs directory of your DPaint disk, Make sure that the file PAL is in this directory and then add this line to your DPaint startup-sequence:

DEVS: Monitors/PAL

If everything else is okay, DPaint

should now access the AGA screen modes. JH

MISSING CHIP

Sysinfo tells me that my late-model A500 is fitted with an 8372A Agnus chip. I was HARDWARE under the impression

that this device enabled the Amiga to use 1Mb of Chip RAM, but AVAIL tells me I only have 512K, with the remaining 1Mb being configured as Fast. Is there any way to increase this, or do I need to replace the Agnus chip? Adrian Howell Swansea West Glamorgan

There are a couple of possibilities here, none of which suggests some fault in Agnus. First, it may be that SysInfo is reading your Agnus chip incorrectly - but I doubt that. It is more likely that the problem lies with the Trapdoor expansion cards you are using. The A500's trapdoor slot is designed to accept 512K of expansion memory (Fast or Chip depending on the configuration of the board and Agnus fitted). Some manufacturers bypass the normal configuration and offer extended versions, although they are likely to conflict with the standard setup. This is the area you should address first. You can check if your Agnus is

CODE CLINIC CODE CLINIC CODE CLINIC

UnloadMessages V loaded (msg_base->messagen_loaded);

Well, it looks harmless enough, but the UnloadMessages routine does a lot of memory de-allocation and resource freeing. It also does no error-checking and assumes that the caller is passing it a pointer to a MsgLoaded structure which is valid. Here is a snippet of the UnloadMessages routines:

struct MagTag mt;

FreeMem(ml->block ram);

mt = ml->first message;

while (mt)

FreeMem (mt); mt = mt->mt Next;

There are actually two problems here, but only one is causing the particular bug in question. The first is that if the MsgLoaded structure passed in just happened to contain garbage, or incorrect data, the FreeMem statements are quite likely to go wrong. In most cases this is likely to cause a FreeMem twice guru to occur. One solution is to

ensure that you never pass this sort of routine an incorrect structure; the other is to change the first FreeMem line to read:

if (ml->block ram) FreeMem(ml->block ram);

Quite a harmless change, only this time, if mi->block ram is 0 then FreeMem can't be called. What this does not cope with is if the area that is freed was not allocated in the first place!

Before we leave this particular chunk of code, note the two commands in the while statement. The second one reads information out of a block of memory that was just freed in the line above. It's possible that another task might grab that memory between the two lines. Unlikely, but possible. The other problem might arise should Commodore ever put proper memory protection in, because the second line will fail because that memory no longer belongs to that task.

Although there have been a couple of things solved there, these were not the actual cause of the problem. The real problem lay in the routine that loaded all this data in

the first place and created the structures, because the author was starting with a structure which was created locally on the stack, filling it in, and then copying it to an area of memory. If it went wrong at all, it simply returned, but unfortunately still copied the structure to the destination memory. The result was that all the un-initialised fields (which didn't get filled in because something went wrong) contained garbage, and hence calls to the UnloadMessages routine would cause some spectacular problems.

An easy fix to this was placed shortly after the beginning of the routine,; it ensyres that the structure contents are all set to zero:

memset(ml, 0, sizeof (struct MagLoaded));

This simply clears the entire structure.

The moral of this particular story is that any structure or variable created locally in a routine is allocated on the stack. This means that unless you specifically put something sensible in it, it will contain a random value, depending on what was on the stack. This will

cause reliability problems. If you want it to be initialised to zeros, you have to do it yourself. Global variables are not affected by this particular problem.

C makes it very easy for you to have bugs like the above. Even experienced C programmers fall foul of this sort of thing. The only way to effectively help reduce this sort of problem is to keep your code welldocumented and organised. At least then, if you do have a problem, you stand a chance of finding it!

JARGON

String - A special kind of C variable, actually created as an array of character elements. Strings are usually passed between functions by passing pointers holding their addresses.

Structure - A class of data storage in C whereby a group of primitive data types - for example, integers, strings and reals - are joined together in a particular order to form a user-defined type.

configured correctly by fitting the standard 512K expansion and testing the amount of Chip RAM available. If this still registers as 512K, then you will need to check Agnus and make some other modifications to the board (they vary according to the revision). It is more likely that you will need to contact the supplier of the extended RAM board and see if there is any way to utilise the extra 512K for Chip memory. I would suggest, though, you are probably better off leaving the machine as it is unless you have a lot of graphics-intensive applications -1Mb of Chip RAM is not necessary for the vast majority of users and you'll usually need a lot of Fast to start enough applications to make it worthwhile. MS

TRICKY POINT

My A1200 has a Power Computing accelerator with FPU and I would like to make more use of it. Am I correct in

thinking that applications have to be specifically compiled to use the FPU? I would also like to know if there is any way I can patch operations to use the FPU. Furthermore, do the maths libraries use the FPU, and if not can I replace them with something that does?

Richard Marsh

Richard Marsh Birchington Kent

Generally speaking the FPU should be transparent in operation. Software can sense whether it is present and load the appropriate libraries, but this is "expensive" in code size. Large applications usually opt for manual use of the FPU by supplying two versions – one based entirely on integer maths and another using the FPU. For this reason, you can't patch the libraries – they are the way they are. **MS**

BREAK THE BANK

I am trying to use my Amiga to enter the Bank of Scotland HOBS system. I can get connected but seem to

ATalk III and Term 1.8 with the correct parity and so on. Do I require extra software to communicate with HOBS? If so what and where can I purchase it? Gail MacTear Isle of Lewis Scotland

The answer is fairly simple: yes, you do need extra software to connect to HOBS. The Bank of Scotland uses a Viewdata system to run HOBS, which is the same as is used by Prestel

and other such message boards. To connect successfully you will need to use terminal software that is written for Viewdata use. There are two options available. The first is RubyView, which is a commercial program but you should be able to pick it up very cheaply if you can still find any dealers stocking it - it is very long in the tooth now. The second option is a public domain program called Supertext, which you can download from most Bulletin Boards with a healthy file area or purchase from a public domain library - see the directory of PD libraries on page 120. DW

FLICKER FIX

Having recently upgraded to an A4000/030, I was looking forward to a flicker-free interlaced

screen when using ProPage 3 and the interlaced screens of DPaint 4 AGA. Disappointingly, there is still flickering evident. I have got the A1942 software update which came with the A1942 monitor, which I purchased at the same time as the A4000.

L Long, Gosport Hants.

There are a couple of things which could be causing you problems with the flickering. You have to tell Workbench that the flicker-free modes are available before it will. make use of them. To do this, you need to have two files, "DBLPal" and "DBLNTSC", present in your Devs/Monitors drawer. To find out whether you have, this is what you do. In your Workbench partition on your hard disk, there is a Devs drawer. Double-click on this, and then on the Monitors drawer inside it. If it does not contain the two files mentioned above, you'll find them in the Devs/Storage drawer. Open this drawer and drag them across to the Devs/Monitors drawer, and then double-click on them to get them going. You then have to access the prefs program "IControl". Ensure

that the gadget "Mode Promotion" is ticked, and then save.

"ScreenMode" preferences, and change your Workbench to a DBL-PAL version of the mode. Then, re-boot your Amiga, and you should have glorious "Flicker-Free-O-Vision"! **75**

WHAT'S INSIDE?

Kent

I am programming with DevPac 3 and would like to know exactly what is contained in the structures of so

many of the Library commands. For example, InitBitMap requires a pointer to a BitMap structure. Is there a book I could buy that would tell me this information?

John Lock,
Sittingbourn

You need to buy the Amiga ROM Kernel Reference Manual Includes and Autodocs, third edition, published by Addison-Wesley. The ISBN number is 0-201-56773-3. It contains all the structure breakdowns, and also a description of all the Library functions on the Amiga. If you want a proper explanation of these structures though, you'll need another of the ROM Kernel Reference Manuals, Libraries (ISBN 0-201-56774-1). This really requires some knowledge of C to understand, but it explains how to use the Library functions, and the structures involved. The Includes and Autodocs book costs around £20. the Libraries one is a little more. expensive, but both are worth their weight in gold if you're serious about programming your Amiga. TS

AMIGA TOO BASIC

I have experienced the following problems using Workbench 3: 1. I am unable to load AmigaBASIC programs

directly from the hard disk by clicking on their icons. The message "unable to load your tool Amigabasic" appears. I have to resort to loading AmigaBASIC and

then entering the program name manually. Is there a more direct method?

 The speech facility in Wordworth does not work with Workbench 3. Is there any way I can use this useful facility.

Evan Morris Ripley Surrey

1. AmigaBASIC is rubbish - which is why Commodore replaced it with the infinitely more useful ARexx in Workbench 2 and above. I suspect this problem has arisen because the AmigaBASIC programs ("Projects") are set with the wrong path for their "Default tool". You can correct this by selecting the offending icon and choosing Icons->Information.... You then need to enter the path for AmigaBASIC in the area for the Default tool. For example, if AmigaBASIC is in a drawer called Basic on the main drawer of your hard drive, you could enter something like this: SYS:Basic/AmigaBASIC

2. This is a nuisance. There does not seem any reason why Commodore removed the text-to-speech that the Amiga was famous for (although it seems pretty rough by today's standards). You can reinstate it to Workbench 3 by obtaining a copy of Workbench 1.3 and copying the following files: Speak-handler (from the L drawer), Translator.library (from the LIBS drawer) and Narrator.device (from the Devs drawer). Remember that these drawers are all hidden on Workbench 1.3, so you will have to use Window->Show... All Files.

If you are feeling brave you may also want to create a "Mountfile" for the speak device as follows:

- Drag the icon "AUX" from the Devs/DOSDrivers drawer to the RAM disk.
- 2. Rename it "SPEAK".
- 3. Open a Shell window and enter the following command:

 DELETE RAM: Speak
- New enter the follow
- Now enter the following command:
 ED RAM: Speak
- When the ED window appears, enter the following short program (called a "Mount"):
 SPEAK:

Handler = L:Speak-handler Stacksize = 600 Priority = 5 Globvec = -1

6. Save and exit from ED and then copy the SPEAK icon back to Devs/DOSDrivers. When you re-boot your machine you will have another device which you can use like a talking disk drive!

From AmigaDOS, the following produces some interesting results: COPY S:Startup-sequence TO SPEAK:

Try it and see! MS (1)

JARGONBUSTING

Basic – Beginners' All-purpose Symbolic Instruction Code is a highlevel programming language, much favoured by micro-computer users.

FPU – A Floating Point Unit is a chip that works with the CPU to carry out complex mathematical tasks. It speeds up the running of some programs, particularly 3D graphics-based ones.

HOBS - Home and Office Banking Service

ViewData – A page based terminal system, using large character blocks to form graphics and text, as used by Prestel. Now largely redundant.

ANOTHER MONTH, ANOTHER DEADLINE ...

Have a good Christmas! Our best wishes to you and yours for a happy and prosperous 1994.

ISSUE 37 OUT NOW IT

The job of any computer magazine is to inform and to educate - and perhaps occasionally to entertain. We at JAM take our jobs very seriously indeed. We understand that we have an obligation to inform you of new developments as quickly as possible, and, more importantly, we have a duty to get it right. Incorrect or incomplete information is worse than no information at all, so we make sure we do our research before passing on to you what we have learnt. The emphasis in JAM is on quality information.

Sometimes that information might be meaningless without a basic understanding of the concepts involved, so when necessary we ensure that we publish general background information that will help you to form your own informed opinions and compare them to those of our Amiga experts and the opinions of other reviewers.

We like to think of JAM as the piece that completes the Amiga jigsaw, enabling you to see the whole picture. Our readership has continued to grow for three and a half years now, so we must be doing something right.

STUDIO WILL ENHANCE THE OUTPUT FROM ALMOST ALL AMIGA SOFTWARE

Studio can make a real difference to the quality of your printouts. It's particularly strong when dealing with colour ... Amiga Format, October 1993

"You need this software if you own a printer." CU Amiga, May 1993 "The quality really has to be seen to be believed!"

Amiga Mart, May 1993

Photocopy or use a separate piece of paper if you don't want to cut your magazine

ast month in our Address Book programming project, we integrated all of our user interface code into the main module, and dealt with some of the things that we are going to have to do in order to get the Address Book running from within the window. This issue, we'll actually be doing that, and getting our pretty window displaying record contents, as well as enabling us to edit existing records by simply clicking in the appropriate string gadget, entering the new field contents, and pressing <Return>. All the source code you need this month is on the cover disk, so load it up and let's get going. We've even given you DICE itself to load it into! (For how to get started with it, see page 12.)

DEALING WITH BUTTON PRESSES

We've already got the code written to enable us to detect that a button has been pressed. Last month's program simply put the button ID number on the screen so that we could see that something was happening. We can perform actions on this number in a variety of ways. One is to use IF statements, but by far the most efficient way of testing multiple values like this is to use the switch() command. We've already looked at switch() in the past, but this time we'll be using an additional feature. Our five control buttons - NEXT, PREV, SAVE, GOTO and SEARCH will need to be dealt with separately, but the other nine represent fields in our current record, so we could deal with them easily without the need for nine separate CASE statements:

```
switch(gad_pressed->GadgetID)
   case BTN PREV:
    /* Previous code goes here */
    break;
   .. repeat for BTN NEXT, V-
SAVE, GOTO and SEARCH ...
   default:
    /* If the above cases didn't
get it, it goes to the default
bit! */
    break;
```

What is happening here is that the five control buttons are handled at the top of the program, and by a process of elimination anything else must be one of our string gadgets, so we use the "default" statement, which basically means "if none of the 'case' statements were used, do this bit". It can be quite handy in a number of circumstances, including error detection.

Since we can only ever have one record shown at any one time, what we'll do is create a few global variables, which dictate what's on screen:

BOOL record_changed = FALSE; /* Flag to indicate we made

```
changes */
long current record
                       = -1;
   /* Current record, -1 if none
yet */
long total records
   /* Total records in file */
char record data [RECORD LENGTH];
   /* The actual record itself */
```

We'll use our first one.

record_changed, to indicate if the record on screen currently has unsaved changes. In future issues, we'll use this to show a requester saying something like "Data has changed - are you sure you want to move to another record without saving it?" (We'll be dealing with requesters next month.) The next variable, current_record, is used to indicate the actual record number that is shown. or -1 if nothing is shown currently. The third,

The symbol means do not type

a return - keep typing to the end of the next

line. You means type

a space, then keep

typing to the end of

the next line.

total records, is calculated at the start of the program and tells us how many records there are in our file. It's quite easy to calculate. A better way to do it than this, however, is to hold this sort of information in an index at the start of the file. However, we're going to do it the easy way. We can simply open the file, find out how long it is in bytes and divide this number by the length of each record, and hey-presto, the number of records:

```
long total_records;
/* Open our file */
if (!(file_channel = Open -
("addresses", MODE OLDFILE)))
 return NULL;
```

/* Calculate total records */ Seek(file_channel, 0, OFFSET_END); total records = (Seek(file channel, 0, OFFSET CURRENT) / RECORD LENGTH);

Close(file_channel);

This enables us to put some basic error checking on the NEXT button to prevent the user from going off the end of the file. We're using a nice feature of the AmigaDOS Seek() function that it returns the position where it was in the file before you called Seek(). So if we seek to the end of the file, and then seek

nowhere at all OFFSET CURRENT. zero bytes), we get the length of file.

Our last global. record data, holds the actual data for the current record itself. We will pass this to the

"write record data" and

"read record data" functions we wrote several months ago.

With this lot all sorted, we can easily

The source code for our Address Book application being edited. You can just load it off the cover disk!

This month Toby Simpson gets our Address Book program up and running in the Amiga's IT'S ON THE DISK window environment.

now implement the NEXT and PREVIOUS button operations. PREVIOUS is really easy; we can simply reduce the current record counter by 1 so long as it is greater than zero, like this:

if (current_record > 0) V current_record-;

When we've done this, we can then update the display by calling a new function we'll write in a while called show current record, which takes a pointer to where the record data will be and the record number itself.

Because we're reading in the total number of records, the NEXT button can be implemented in a similar easy way:

if (current_record < V (total_records-1)) Va current_record++;

and running.

The other important button to implement is the SAVE one. This button will save any changes that you have made to the current record. Since we keep tags on both the record number and whether there have been any changes, this is also now very simple to implement particularly since we've already written a routine to save a named record to disk, "write record data":

if (current_record >= 0 V && record changed) /* Save any changes */ write record data (record data, current record); record changed = FALSE;

The first thing we're doing here is checking to see if there is a record to save, and if so, whether there have been any changes to save. Remember that we set current_record to -1 if there is no record displayed, and we set record_changed to TRUE (it's a boolean variable) if there are any changes. So, if the record is 0 or higher and there are some changes. we want to save it. We're using the and function, "&&", to do this. If there is something to change, we call our write_record_data routine to write the record straight to disk, and then set the record_changed flag to FALSE, because there are no longer any unsaved changes.

As you can see, it's all nice and straightforward. Perhaps the most complex bit that we'll have to do with our button result code is to deal with

Success at last - the first record showing on screen! There's still some way to go, though - stick with us...

the user pressing <Return> in one of the string gadgets, meaning that they've changed something. This code sits in our default: part of the gadget switch statement. It looks a little like this:

record changed = TRUE;

/* Copy changed field across... */ field_offset = record_data;

for (loop = 0; loop < V gad pressed->GadgetID; loop++) field offset = field . offset + field lengths[loop];

strcpy(field_offset, Ve ((struct StringInfo *)(window * gads[gad_pressed->GadgetID] .SpecialInfo))->Buffer);

The first thing we're doing is setting our record_changed flag - because there have now been changes. We then have a character pointer which we set to be equal to the start of the current record. We then want to find the offset into the record where the field to change is. We find this in the above "for(...)" loop. If, for example, the user pressed <Return> in the third line, then the offset would be equal to the lengths of the first two fields from the start of the record. So, since our gadget ID is equal to the field number, the above loop does the trick nicely.

Then we have a rather complex looking strcpy command. We've looked at strcpy before - it means string copy, and it works like this:

strcpy(destination, source);

Our destination is the calculated offset, and the source is the gadget data buffer which Intuition looks after. This updates the internal copy of the record according to changes. If we then pressed on our SAVE button, it would pick up that there are changes and save the data for us.

Because we have not yet integrated the "Create New Record" function into the program, this month the SEARCH button is temporarily tied to the original create_record() routine we wrote all those months ago. This at least allows us to add new records to our file and display the results.

The biggest new routine that we add this month is the one which displays a named record directly on the window itself. This is called after the **NEXT** and **PREV** buttons are pressed, and in future versions will also be used after GOTO and SEARCH

to update the window contents. We mentioned it briefly above when we talked about the actions of NEXT and PREV, and

it's going to be called show_current_record. The prototype for this function is this:

BOOL show_current_record . (char *record data, Velong record id);

We pass it a pointer to where the record data is to be placed, and the record number we want to show. We already have these values defined, "record data" and "current record". Let's have a little look at show current record:

char *field offset; int loop;

/* Attempt to read the named record */ if (! (read_record_data -(record_data, record_id))) return FALSE;

** Before we alter the gadgets, we must remove them

RemoveGList (addr_window, Vwindow_gads, -1);

** Now go through record, copying fields to string gadgets. field offset = record data;

for (loop = 0; loop < V TOTAL FIELDS; loop ++) stropy(((struct String

Info *) (window_gads[loop] * .SpecialInfo))->Buffer, V field offset);

field offset = field offset Va + field lengths[loop];

** Now they are updated, we can add them back and refresh the window

*/ AddGList (addr_window, Vo window_gads, -1, -1, NULL); RefreshGList (window_gads, Vo addr_window, NULL, -1);

** Now show something sensible on our window title

sprintf(window_title, V "Record %ld of %ld", Vo record id+1, total_records); SetWindowTitles(addr window, Vwindow_title, (UBYTE *)-0);

return TRUE;

This introduces a whole load of new intuition.library functions which we have not used before. This is what the function does:

- Read the record data into memory. Return FALSE if it was unable to.
- Temporarily remove our gadgets from the window. The manuals state that it is illegal to operate directly on the gadget structures when they're still attached to the window.
- 3.Loop around, setting each gadget string buffer with the appropriate field content. Note that we're using the same procedure we used before. to set field contents when the user pressed <Return> inside one of the string gadgets.
- 4. Add the gadgets back to the window, and tell Intuition to refresh them so that they look right.
- Change the window title to show which record we're showing and how many there are in total. This simply looks nice and gives the user some idea of what is going on.

Part 1 we've already done - we wrote a read_record_data some months ago - so we just call that with the appropriate parameters. The new Intuition functions we're using are responsible for the removal, updating and adding of gadgets to windows. They are very versatile, you can actually add or remove single gadgets, groups of gadgets, all sorts of things. It's best to consult the AutoDocs for the function to find out exactly what it can do. Finally, in part 5 we set a new window title.

NOTE: This is a common error! Note that the window_title string is a CAUTION global variable. This is

important. If we were to accidentally declare it locally to this function, then everything would go horribly wrong as soon as we exited it because any local variables are instantly eliminated. The next time Intuition chooses to update your window title, for example, your window becomes unselected, and then it will look to an area of memory which no longer contains any useful data. The result is a corrupted title, which looks messy. Do remember that anything that needs to remain intact after a function is used should either be correctly allocated in memory or declared as a global variable.

All that remains, then, is to integrate this lot properly into the

program and make the necessary changes to the prototypes file to add our new function definitions. Also, we're adding some #defines for the control buttons into address book.h. A few variables have now had to be declared as external too, particularly the field_length array, so that other code modules can access them.

COMPILING AND USING THIS MONTH'S LISTINGS

The current source is on this month's cover disk, and was compiled, tested and run using DICE 2.06.21, freeware release. You will need the Commodore Includes in order to compile the program. If you need to get hold of the includes. then send off for Commodore's excellent Native Developer's Toolkit. The address is:

Developer Support, Commodore Business Machines (UK) Ltd., Commodore House, The Switchback, Gardener Rd., Maidenhead, Berks., SL6 7XA

Send a cheque for £25 sterling made payable to "Commodore Business Machines (UK) Ltd.", and ask for the "latest Native Developer's Toolkit". The newest version of this toolkit, for Kickstart 3.1, should be available by about now. The Toolkit comes with the Includes, plus autodocs on disk, together with stacks of example code and useful debugging and programming utilities. Well worth the money.

Next month we'll be looking briefly at ARexx as a way of providing power to a program, then neatening things up by adding requesters to tell us what is going on, and then we'll explore the integration of creating a new record into the GUI.

Toby Simpson is available for electronic mail on CIX as "toby" and over the internet at "toby@cix.compulink.co.uk".

JARGON BUSTING

AutoDocs - The autodocs describe the operation of each of the Amiga operating system's individual functions. You can buy a book with this lot in, and they're also available on disk with Commodore's Native Developer's Toolkit.

GUI - Graphic User Interface. The term used to describe all the buttons, icons and windows on the screen, as a way of controlling programs. The Amiga's GUI is named Intuition.

Greased lightning!

Can it be true? A programming language with which you can produce super-fast games and real Workbench programs? Simon Green gets Blitzed by Blitz Basic 2.

ong ago, there was only one version of the BASIC language for the Amiga. It was called, appropriately, "Amiga Basic" and came free with Workbench. To many people who had upgraded to the Amiga from an old 8-bit machine, it seemed incredibly powerful - and there weren't even any line numbers! Alas, it was discontinued with the advent of Workbench 2, and, on a lot of tasks, it was painfully slow.

Next came HiSoft and GFA BASICs. These were much faster and more reliable than old Amiga Basic, and were great for writing OS-legal programs, but still didn't allow much control of the custom graphics hardware that had made the Amiga such a successful machine. There didn't seem to be any way in which the average user could create fastmoving graphics of the sort seen in commercial games, without resorting to learning C or assembly language.

Then AMOS arrived. It offered a full version of BASIC, but ditched the Amiga's Operating System in favour of its own fast, hardware-level routines. Now even beginners could write programs with scrolling, moving sprites, sound effects and music.

Now there's Blitz Basic 2. This

newcomer claims to be a real programming language with enough low-level control to make high-speed games a reality. Its forerunner Blitz Basic 1 was never truly released in the UK and was only really used by a dedicated cult of Blitz programmers. Blitz 2, however, deserves to reach a much larger audience.

A SPEEDING BULLET

So, how much faster is Blitz Basic 2 than AMOS? To test the comparative speeds of the two languages, I devised a simple benchmark program. The benchmark consists of drawing a number of bouncing balls on the screen. Each ball is an eightcolour, 16 x 16 pixel graphic (a "bob" in AMOS, a "shape" in Blitz). The screen is double-buffered to eliminate flickering, and the balls had to preserve the background graphics, as is usual in arcade games. The task was to see how many balls could be drawn and animated in a single video frame (that is, in a 50th of a second). I found that Blitz Basic could manage about 16 balls per frame, but, try as I might, I couldn't push more than about 8 or 9 balls per frame out of AMOS. However, I discovered that if I disabled multitasking using the

"Multi Off"

instruction from the Craft extension, AMOS could achieve the slightly more respectable figure of 11 balls per frame. But, I also found that if I switched off the run-time error-

checking in Blitz Basic, I could obtain a frankly obscene 30 balls per frame!

Obviously these figures aren't necessarily representative of the speed of the languages as a whole, and I don't claim these are the best possible values, but it does give a rough indication of the performance differences you can expect to find.

The first important thing to realise about Blitz Basic is that is a compiled-only language. Unlike AMOS, which is based on an interpreter, all Blitz programs must be compiled (that is, converted into machine code) in order to run. This has the obvious advantage that you don't need to buy an additional compiler in order to produce fast, stand-alone programs.

Blitz Basic being compiled-only is not as much of a disadvantage as it may sound, since Blitz comes complete with an interactive run-time

SkidMarks - a top-class racing action game, to be sure, but could it have been written in AMOS?

debugger. This provides most of the same functionality provided by AMOS's direct mode and monitor program, except it operates directly on the compiled program. You can stop the program at any point, and the debugger will open a small screen displaying the source code to the currently executing statement, plus a few lines either side. You can then step through the program a line at a time, examine the contents of variables and even execute commands directly. This can be an invaluable aid when developing and debugging programs.

Blitz Basic can operate in two modes - Amiga mode and "Blitz" mode. Amiga mode is the default and enables you to write conventional programs that make use of the operating system routines to open screens, output text and draw graphics. This is the mode you would use to write proper, multitasking Workbench applications. However, to obtain maximum performance, you can use "Blitz" mode, which disables multi-tasking and takes over the machine completely. This allows full and direct control over the Amiga's hardware.

At first glance Blitz Basic seems a much lower-level language than AMOS - that is, closer to the level of the machine. For example, to open a screen in AMOS, you simply specify the number of colours you need, and "LowRes" or "HiRes" to choose the resolution required. In Blitz, however, you need to set the correct bits in the viewmode parameter to select the resolution, and specify the number of bitplanes required.

Drawing bobs (blitter objects) and double-buffering (which is essential for smooth animation) in Blitz are also much more involved than in AMOS. For example, if you want to open a double-buffered screen in AMOS and draw some

VISITING UNCLE TED

Most of your time with Blitz Basic will be spent in Blitz's integrated editor/compiler environment - "Ted". The edit/compile/execute cycle is very fast - you just edit your program, select "Compile/run" from the menu, and in a short while (depending on the length of your listing,

obviously), your code is up and running. In fact, Blitz often seems to compile and run your program in the time it would take the AMOS interpreter to just test it! As you'd expect, programs can also be compiled to disk for later execution.

As an editor, Ted is perfectly usable, if a little

quirky. I was particularly annoyed by the way pressing <Return> inserts a new line below rather than above the current line, and the fact that it's impossible to delete a line by using <Backspace> or <Delete>. And it seems to refresh the screen more than you would have thought

was strictly necessary. Unlike the AMOS Professional editor. Ted doesn't allow multiple edit windows to be opened, which can make cutting and pasting code between programs a bit tedious. But I'm probably just being picky - you can always use your own favourite text

editor instead.

Ted does have some nice features - it automatically highlights recognised keywords in a different colour, and you can get it to list the main labels in your program in a column on the right-hand side of the screen for quick and easy access to different sections

Biltz's integrated editor and compiler, Ted. You'd better get used to looking at this screen...

of the code. The syntax of some of Blitz's commands can be a little complex, to say the least, but fortunately Ted includes a simple on-line help system that can give a list of the parameters of any keyword. It's still not really ideal for novices, but it certainly helps.

Open" to open the screen, followed by "Double Buffer" to double-buffer it, and then just use the "Bob" command to draw your bobs. In Blitz, you have to allocate two bitmaps, set up a "slice" and manage all the double-buffering and the drawing and erasing of the objects yourself (using Blitz's "Blit" commands). The advantage of this approach is that it is faster and gives you much more control over what is actually happening.

It's also good to see that Blitz allows IFF samples (8SVX format) to be loaded directly, which is still a big omission from AMOS. There is even a "DiskPlay" command that enables long samples to be played directly as they are loaded from disk.

A more unusual feature is that Blitz also operates as a fullyfunctional assembler. You can freely mix 68000 assembly language instructions with BASIC commands. This means that experienced programmers can replace timecritical routines in their programs with faster machine-code equivalents. It is even possible to set up your own interrupts that will automatically call a specified procedure on a regular basis. The compiler/assembler also provides all the features you'd expect, including conditional compiling and macros. In fact, in some ways Blitz Basic 2 feels more like a high-level assembler than a compiler as such.

Blitz also borrows more than a few features from the C programming language. Probably the most interesting of these features are "NewTypes". These are the Blitz equivalent of C's "struct" data structures or Pascal's "Records". NewTypes enable new data types to be created by grouping together a number of different basic types. A NewType can be thought of as a record containing a number of different fields, each of which can hold a different item of data. This means that rather than using several different arrays to store all the data in your program, you can use arrays

The Blitz map editor enables you to piece together screens from a selection of small graphic tiles, saving time and storage space. I used to love Lego too...

of NewTypes instead. Neat.

Masochists will be pleased to hear that Blitz also includes a pointer type. Simply put, a pointer is a variable that holds the address in memory of an item of data (it "points" to the data). Pointers are used extensively in C to pass references to data between functions. So now you too can confuse people (and probably yourself) just as much as those clever C programmers do. On a more serious note, NewTypes and pointers also provide a useful method of representing and accessing the Operating System's data structures and libraries from Blitz Basic.

Another novel feature is built-in support for linked lists. Linked lists are an alternative method of storing data to conventional, linear arrays, and a more efficient one. They make some types of list processing much simpler and faster than if arrays were used. Lists in Blitz are allocated in a similar way to arrays, using the "Dim List" command, Items can then be added and deleted from the list very easily using single commands. The system automatically keeps track of the current item, and you can step through the list using the "NextItem" command.

Blitz Basic's IntuiTools utility enables you to design Intuition interfaces with your mouse, without worrying about any of those complicated commands.

These features together make Blitz Basic a much more concise, flexible and elegant language than some other versions of BASIC.

PROOF OF THE PUDDING

One of the other big selling points of Blitz Basic 2 is that it provides full support for the Amiga's graphical user interface, Intuition. Finally it is possible to write proper, multitasking

> Workbench applications in BASIC, Blitz includes commands for creating screens, windows, pull-down menus and all those gadgets we all know and love. The latest version of Blitz even includes support for ARexx, which enables Blitz to communicate with other programs, as well as a facility called BRexx, which allows you to control

other Intuition programs by fooling the system into thinking that the mouse or keyboard is being used.

Other interesting features include support for playing IFF (Deluxe Paint) animations, MED music modules, and synthesized speech using the Amiga's narrator device. However, support for AGA graphics is not yet complete. It is

possible to open AGA format screens under Intuition in Amiga mode, but although it is possible to set up 24bit palettes in Blitz mode, AGA screens and shapes are not yet feasible.

Of course, in addition to these more unusual features, Blitz Basic also includes everything else you'd expect from a modern version of BASIC, including string handling, file input and output, procedures, functions, and all the control structures you could ever need, and probably a few you don't.

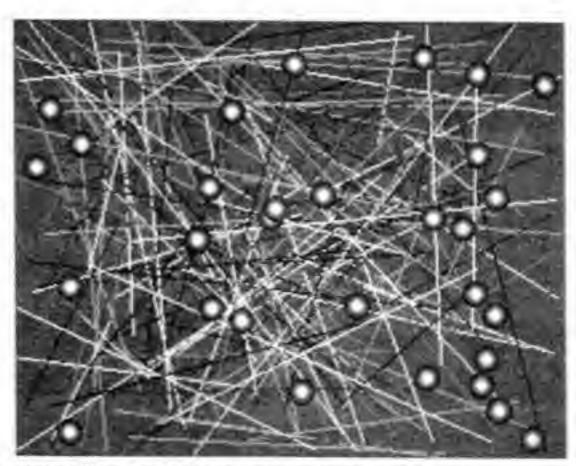

The package comes complete

with a selection of ready-compiled tools, including an Intuition interface designer called "IntuiTools", a Map editor called "MapEdit", and "ShapesMaker", which is for grabbing shapes from IFF pictures. None of

these appear to be documented anywhere, but it doesn't take long to figure out how to use them.

My only real concern about Blitz is that it seems to be quite unstable on some machines. I managed to crash it several times just trying to run the example programs. However, you have to remember than Blitz is still a relatively young product, and I'm sure that in time these bugs will be exterminated. The only other criticism I would make is that the documentation, although quite professionally produced, is somewhat lacking in details and explanations in places.

Of course, the biggest testament to the power of Blitz Basic is the quality and speed of the software that has already been written using it. Sure, there's been a few nice programs written in AMOS (most notably a certain game called Extreme Violence), but nothing that really rivals SkidMarks, Defender or Insectoids 2 in terms of professionalism and playability. And with Blitz's Intuition capabilities.

With Blitz Basic 2, you can animate this many bouncing balls every 50th of a second. Wow!

there's no reason why we shouldn't see some groovy Workbench utilities written in it as well.

I wouldn't recommend Blitz Basic for beginners or people of a nervous disposition. It is, however, ideal for frustrated AMOS programmers who reckon they've pretty much pushed AMOS to the limit, or for people looking for a proper, structured version of BASIC that can be used to write real Workbench applications. And it's also a very good stepping stone on the road to pure assembly programming.

Features

You name it, Blitz Basic has got it.

Documentation

0000000000

Adequate, but a bit incomprehensible in some places.

A nicely-integrated programming

environment, but the language itself takes a bit of getting used to.

Performance

Ease of Use

Unbelievably fast in Blitz mode – only assembly language would be quicker.

Value for Money

Excellent. The price compares well with

other programming language packages.

Overall rating

The best implementation of BASIC since AMOS, but not recommended for beginners.

Nexus Prom

Background Picture Sets

High Quality AGA Colour IFF Pictures, perfect for videotitling! Work in all Amiga Paint and Presentation Packages (DPaint, Scala, etc.)

(Also available for Pre-AGA Amigas on request)

Set One : Papers

Various paper types, including parchments, marbled, embossed.

Set Two : Fabrics

Varied fabric backgrounds including silks, cottons, leather, etc.

Set Three : Textures

Various textures including woods, stonework, etc.

Set Four : Travel

Including famous landmarks from around the world, perfect for use as chromakeyed backgrounds or for holiday video title backgrounds.

Set Five : Weddings and First Communions

Including parchment, scrolls, flowers, romantic backgrounds, etc.

Set Six: Introduction Pack

A compilation from the previous sets, ideal for new users.

Each 10 disk set is available at a cost of only £29.99 inc. P & P. or buy the whole range for only £130.00.

Send cheque or postal order made payable to : VIDEOWORLD, 8 Ardoch Gardens, Glasgow, G72 8HB. Telephone 041 641 1142 for more information.

1993/4 WITH ARTIFICIAL INTELLIGENCE THE LEGENDARY POOLS PREDICTION AID, Poolswinner, now has artificial intelligence. The latest version of the program, Poolswinner Gold, has the power to learn from the results of its

own predictions, constantly adjusting the prediction formula to improve performance.

AUTOMATIC FIXTURE GENERATION: Fixtures for English and Scottish League matches are generated automatically by Poolswinner Gold (yearly updates are available from Selec).

MASSIVE DATABASE 22000 match database over 10 years.

 PREDICTS SCOREDRAWS, NO-SCORES, AWAYS and HOMES Predictions are based on many factors .. recent form, the massive database, league standing, goal scoring rates, and draw averages.

The user can adjust all parameters.

SUCCESSFUL Selec guarantee that Poolswinner performs significantly better than chance.

LEAGUE AND NON-LEAGUE matches are covered. Can be used for the non-league and amature matches often on the coupon.

• FULL LEAGUE TABLES (home & away) are automatically

generated by the program as results come in.

UPDATED WEEKLY. Poolswinner Gold is supplied fully updated with all league results from the start of the season

IMMEDIATE USE No need for thresome input of previous results. All results are

already in the program - predictions can start immediately.
 PACKAGE CONTAINS disc, detailed operating manual and support literature.

Also available from Selec _

COURSEWINNER V4

THE PUNTER'S COMPUTER PROGRAM. With artificial intelligence. Uses past form, going, distance, speed ratings, prize money etc. Contains British course statistics - best lockeys, trainers, draw effect etc. Detailed analysis of all runners in a race, with profit. Sophisticated aid to successful betting, with a long pedigree.

POOLS PERM PLUS

Perm analyser and checker, complete with 5 years of coupon results and popular perms for analysis. Checks your weekly entry for winning lines, or tests your theories on results over the last 5 years. Reveals all the weeks a bet would have won, and the probable dividend.

Testimonials from Audio Gallery Users:

"It is really more than just a dictionary. I would have bought this much sooner had I known how in depth it is. As a Foreign Language teacher, I really appreciate it This is a very high quality product...one of the first computer FL programs. to use current FL methods." Ankeny, IA

"Wowee! The Spanish Audio Gallery Demo Disk is wonderful. Words can't describe how pleased we were with the sample. What a great great learning tool. Please let us know when you have available Spanish Audio Gallery #2. Thanks again for such a wonderful product. You have a winner on your hands." Bartonville, IL

Reviews from Amiga Magazines:

"A truly original idea is a rare thing. Fair-Brothers, Inc. in the US has apparently achieved the impossible by releasing a product that stands alone in the market, offering the answer to a question that's hitherto been ignored...the mustering of a foreign language... it could become the perfect learning tool for all ages." Amiga Computing

"If you're just starting to learn a foreign language, the Audio Gallery series is indispensable as a learning tool. If you're planning a trip abroad, a good phrasebook and the appropriate Audio Gallery title will give you everything you need to know to survive in the language. I highly recommend the whole series." .info

"There has been nothing like this on the market before and I recommend it for language teachers and anyone (who) wishes to add to their langguage skills." Peter Furey. Western Australia

The program makes use of the Amiga's excellent sound capabilities and provides digitized voices of native speakers - a most expedient way to learn a foreign language." Amiga World

CHECKOUT NCOMMAND PRO

Features

Provides every type of gadget you could ever need.

Documentation

A professionally-produced manual, which gives full details of every

Ease of Use

procedure.

Fairly straightforward to use, once you have studied the example programs.

Performance

NCommand programs can be a bit sluggish when interpreted, but run perfectly once compiled.

Value for Money

Good value, especially considering the amount of effort that has obviously gone into making it.

Overall rating

A brave attempt to try and standardise the notoriously inconsistent user interfaces used in AMOS applications.

MOS is not simply a games programming language. There are actually a lot of

programmers out there who use our favourite BASIC-variant to write serious applications and utilities.

Unfortunately, AMOS doesn't yet run under the Amiga's standard GUI (graphical user interface), Intuition, so AMOS applications haven't had a consistent user interface. Authors have been forced to write their own interface routines from scratch. AMOS does provide a few basic commands for creating pull-down menus, text windows and slider bars, but they're pretty low-level, and it still takes quite a lot of effort to design your own user interface using them.

NCommand provides a set of about 50 procedures that enable you to produce AMOS user interfaces. that emulate the look and feel of Workbench 3, no matter what version

00000000 SHOPPING LIST

AMOS NCommand Pro v3.0 ... £15 From: Oasis Software, 392 Birch Road, Wardle, Rochdale, Lancs OL12 9LX ≈ 0706 376572 (after 6pm)

NCommand

of the operating system you actually have. It includes some quite powerful routines for opening screens, drawing boxes, inputting text, and for producing all those other nice "Basrelief"-look gadgets that we're used to. There's even a fully-functional file requester that's better in some respects than AMOS's built-in one, and a text displayer.

The package includes versions compatible with both original AMOS and AMOS Professional, and comes complete with a small selection of well-written demonstration programs. These include an address label printer, a disk label printer, and even a screen designer that can produce the source code to the interfaces you design. However, the fundamental problem with NCommand is that although it superficially makes your

programs look as if they're running under Workbench, in fact they are not. Because AMOS always runs on its own hardware-level screen, NCommand programs don't allow proper multitasking

(except by using the <Amiga>-A key combination to toggle between AMOS and Workbench), or use of the clipboard or any other advantages of a real Intuition Interface.

It's worth noting that a very similar extension, called simply Amos Interface, was given away on the cover disk of our sister magazine, Amiga Format, a few months ago.

To be fair, we can't really expect the author to completely re-write Intuition from scratch in AMOS. NCommand is an elegant, well written and completely usable GUI in its own right, but it's no replacement for a real Intuition-based interface.

The only question that remains to be asked is - what the hell does that "N" stand for?

Simon Green

This test interface shows most of the different gadgets that are available in NCommand. Sexy, aren't they?

igaMem is a virtual memory tool for the Amiga. It enables you to allocate large

chunks of your hard disk as "RAM" and fool the system into thinking that it is real memory. This enables you to perform memory-hungry operations such as rendering large objects, DTP, and so forth without having to buy vast quantities of RAM. The catch is, it requires an MMU (memory management unit) to work. This means you'll need a 68020, 030 or 040 based Amiga to use this product, and you must have a working MMU also. The 68EC030

CHECKOUT GIGAMEM V3.0

Documentation

Clear and easy to follow.

Ease of Use

Use the standard Commodore Installer to set it up and then it's plain sailing.

Value for Money

Cheaper than extra RAM if you have the hard disk space.

Overall rating

Highly recommended, if you have the hard disk space and the MMU required to make it useful.

in the A4000/030, for example, is unsuitable. (Note too that previous versions of GigaMem won't work with 68040 chips, but v3 does.)

GigaMem is surprisingly easy to install and get set up. I tested it on an A4000 fitted with a third-party 68030 board containing an MMU. The standard Commodore Hard Disk Installer tool is used, so it was a quick breeze through that to get it all going. One re-boot later, and I was up and running.

You can operate GigaMem in two ways. You can either allocate a whole hard disk partition to be used directly by the program as memory, or it can use a swap file instead. A swap file is a large file created by GigaMem that sits anywhere on your hard disk and contains the virtual memory. Swap files are far more risky, because if something goes wrong the whole partition could fail. Also, there are several restrictions on using applications that utilise GigaMem on the same partition as the swap file. I set it up initially with

000000000

SHOPPING LIST GigaMem v3.0£69.95

Distributed in the UK by: Gasteiner Technologies, Unit 2, Millmead Business Centre, Millmead Road, Tottenham Hale, London N17 9QU. **=** 081 365 1151.

a 5Mb swap file to see if it really worked as well as rumoured.

GigaMemPrefs enables you to specify how your virtual memory is to be configured and which applications will be able to use it. It comes with a whole list of applications which are known to work with the package. It is possible to add others to this list also, but some may not work, or only function in a limited manner. I tried it out with ADPro, Imagine and CygnusEd Professional - and it really did make those vast rendering jobs feasible on an A4000 with only 4Mb of real memory.

The catch, of course, with virtual memory is that it is on disk, and hard

disks are considerably slower than real memory, so any jobs which make use of virtual memory will take longer than normal. Rendering jobs, for example, can take weekends to complete rather than an evening. However, if you already have a large hard disk, and you can't afford to buy large quantities of RAM that you're only going to use on

those special occasions, then GigaMem is the tool for you. It's the sort of thing that's so handy, it should really be built into the operating system.

I had very few problems with GigaMem, mostly to do with some of the debugging tools that I run. It refused to operate with the latest version of the debugging tool Enforcer that I have, even though the manual said it would be fine, and caused some network problems. Other than that, it worked faultlessly; the manual and supplied software are well put together and very easy to understand.

Toby Simpson

GigaMem enables you not only to set up virtual memory but also specify what programs can use it.

Get it all together

Macro68 make the bold claim that this is the best Amiga assembler you will ever use. I use HiSoft's DevPac 3 on a daily basis to program computer games, as part of my job as Lead Programmer at Millennium Interactive Ltd. I was therefore interested in this claim, to say the least. Anything that could improve my productivity would be worth its

Macro68's almost obscenely configurable control program. Shame about the near-unreadable fonts.

Toby Simpson tests Macro 68K's impressive claims about being the world's greatest assembler.

weight in gold.

Installation, thankfully, is done using Commodore's Installer program, and it is extremely friendly and easy to use – and takes just a few minutes. Although it is possible to run this program on a floppy-based system, I doubt that it would be

practical for serious development.

Time to get started. I began with a real-life scenario and simply ran the assembler itself to see what happens. A file requester popped up, but unfortunately this failed to format itself to my screen fonts and looked less than neat. It would have been nice if the program had called the asl

requester for users of Workbench
2.04 and above. In at the deep end, I
took the Amiga CD32 version of
Diggers and attempted to assemble
it – 33,000 lines for the main
module. Unfortunately, I was unable
to get it to assemble with Macro68.
It found all sorts of strange errors,

and with a program that size I didn't have time to convert the source to a format that Macro68 understood.

Time to look at the assembler in detail. Macro68 is a command line based assembler, and not a fully integrated package. Its direct competition in this country is HiSoft's DevPac 3, which comes with a full screen editor and

debugger. Macro68 does not come with a debugger – you have to buy one separately. Macro68 takes a great deal of setting up in order to get right. Its options are complex, and the option setter screen, designed to make this job a little more friendly, doesn't help by using

An assembly in progress, showing the sort of info that Macro68 gives, and its speed: 136,000 lines a minute.

An invaluable resource?

which means that it takes machine code instructions and converts them back into assembly language, making the program easier to understand and therefore debug. It can't create C or any high-level language from machine code, but if you have a fair

Picture 1: the results of a conventional disassembler. Fancy trying to make sense of this lot then?

understanding of assembly language, a disassembler can go a long way to help you figure out how something works (or why it doesn't).

There are lots of disassemblers on the market, and quite a lot of very good public domain ones. Where Resource is unique is the degree of disassembling that it can actually do. Most disassemblers simply convert machine code to assembly language, end of story. Some, particularly those that come with debuggers (such as HiSoft's excellent MonAm, shipped with the DevPac 3 assembler) will also label things if special debug

information is appended to the end of the machine code program. Resource, however, with a little patience and a little deduction, can enable you to take a machine code program and disassemble it so far that not only can you alter and reassemble the results, but you can come very very close indeed to the

original assembly language program.

Getting started is easy.

Commodore's Standard Installer program is included, so if you have a hard disk, getting set up is a doddle. The documentation is excellent, with a good "Getting Started" section

which takes you through an example disassembly, and you soon see just how flexible Resource actually is.

Where it differs from conventional disassemblers is that you can gradually build up a more and more readable disassembly. Exactly how does it achieve this? Well, a raw disassembly of a program without

debugging information is simply a collection of numbers and values, as in Picture 1 at left. These numbers are pretty difficult to follow. even for experienced programmers. particularly if there is more than a screenful of it. Having to decode and understand a decent size program - say about 2 to 3K

nightmare. Resource performs its magic by enabling you to replace occurrences of numbers with meaningful names, and gradually work your way back until you have a reasonably accurate representation of the original assembly language. The

result is accurate enough to be reassembled afterwards, which is quite an impressive achievement.

To use Resource you just load in your file and select "Disassemble" from the menu, instructing Resource to scan the entire file and make its best guess as to what is data and what is code. It is impressively accurate, and the results give you your first clues to work from in order to further disassemble the file. See Picture 2 to see the results of this.

Picture 2: a disassembled program, freshly loaded into Resource and before we start work on it.

For example: Resource identified a reference to dos.library at the start of the program. A quick look at the following few instructions revealed that the dos.library was about to be opened, and the result stored in label reference "lbL000164". Our first step

Macro68 certainly isn't as easy to use as DevPac, or as forgiving: it found errors in perfectly runnable code.

a font so small that you need a magnifying glass to read it.

Macro68 is a full macro assembler, capable of assembling code from the 68000 to the 68030. and also the codes for the 68851 MMU and 68881/882 FPUs. It also assembles Copper instructions, has a wide and complete range of assembler directives, and is capable of putting information about errors in real time to a message port which can be read using ARexx. The manual is a bit flakey on this - it skips over it saying that it is "beyond the scope of the manual to provide detailed instructions for its use", and

was to tell Resource that in future any

references to Ibi000164 should be

looking better already. You can now

operating system use dos.library.

friendlier. I knew that the first one

was a call to OpenLibrary, and

Resource spotted this. I saw two calls

easy to identify. I moved to the line in

to dos.library functions - they were

called "_DosBase". Things are

see which of the calls to the

instead points you to the examples. For a beginner, this would be nigh-on impossible to grasp. Examples are provided for the CygnusEd text editor (reviewed on page 36 of this very issue, coincidentally] and allow the assembler to jump to the lines that contain faults as they happen.

Unlike DevPac 3. Macro68 is able

to assemble the new syntax of 68000 assembly language, as defined by Motorola. Its customisability is amazing. If you spend enough time on it, you can virtually construct your own assembler in the way you want it to look. You can even define the final output strings that appear when assembly is complete. I'm not too sure how useful this would be in real terms, but it's there.

The manual is a bit hard to follow. There's no index, and finding a particular point can be very hard indeed. This is what made it hardest to convert assembly language that

minutes from start to finish I was able to make sense of several K of program. Picture 3 shows what I was able to do.

I started with quite a complex program, which I had no remaining documentation for, and I knew that it did not have debug information. I did this on purpose, because I knew that with a conventional disassembler I would be unable to understand what was going on, probably even after a weekend's work. Resource tackled it

question, told Resource to look up Resource 989198 825,04 PC1,A1 Program Start OpenLibrary, A6) CAN Alloc TAIL LVOCtuseLibrary,A6) No Dos Lib dos. library', #

Picture 3: the same program, about 15 minutes later. This is starting to make a lot more sense as code.

finding its use by getting back all the names to calls of OS routines (and things were easier now because of references to STDIN, STDOUT and

DosBase), I was quickly able to identify what each of the routines did and name them. In a matter of ten

effortlessly, and I hardly had to touch some of its more advanced features.

Resource comes with a good few useful utilities, and a configuration program which enables you to change pretty much everything. I was a little alarmed though that the Configuration

worked fine on DevPac 3 across to this assembler. A blessing is that the documentation is supplied also on disk, in a sort of Hypertext format. The Hypertext driver does not like it if you don't use Topaz 8 point as your main font, but nevertheless it's a valuable addition to the package.

THE BOTTOM LINE

If you're a beginner, check out HiSoft's DevPac 3. It is a fully integrated package, complete with an advanced editor, a powerful debugger and disassembler, and it's a whole bundle easier to use. The manual for it is very well laid out with a comprehensive index and table of contents. After spending a couple of weeks playing with Macro68, I can honestly say that I would not leave DevPac for it. HiSoft is much more friendly and easy to use, and a lot less complex to set up. I also enjoy the editor, and the debugger, and the ease of looking anything up in the manual, in addition to this lot, DevPac is cheaper.

If you're a professional who needs the configurability and access to the Motorola new syntax, then maybe Macro68 could be the assembler for you. But if you do buy it, be warned: you'll need to buy a separate debugger and editor if you

program gave an Enforcer hit; an illegal byte write to location FFFFFFF. No commercial program should have Enforcer hits in it.

One thing to watch for: Resource can be more than a little greedy with memory, though this is to be expected, given what it can do. A 10K object file that you are going to run through Resource will take up about 100K. The documentation suggests that you will need at least ten times as much memory as the size of the program in order to work on it. For example, if you have a 20K file, by the time you have finished creating labels and working on it you are likely to have used about 200K of memory.

THE BOTTOM LINE?

Quibbles. I had to think long and hard about this one. The Puzzle Factory have really come up with a powerful tool here. And anyone who is thinking of buying a disassembler really should look no further. The only thing is that for most people, something this extensive might not really be necessary - it is an extremely specialised product. It's certainly not a debugger, by any stretch of the imagination; it is simply an exceptionally advanced disassembler. If you already own a reasonably good one, say MonAm 3, which comes with HiSoft's DevPac, then to be perfectly honest it's unlikely that you would get your money's worth out of Resource.

don't already have them. And again, if you're a beginner you will have a really hard time with this. (33)

The best disassembler I have ever seen, but definitely a highly specialised product - make sure you really need it. before purchase.

The ACC Hardware Programming Manual

his is a four-disk guide to programming the Amiga using the hardware directly, using 68000 assembly language. It comes complete with a linker and assembler (a particularly good PD assembler called A68K) - in fact, all you need to get started learning assembly language on the Amiga.

There's plenty of documentation and installation is easy, though there is no hard disk installation facility, so you'd have to do that yourself. The tutorial is divided into modules, each containing text explaining what's going on, some examples and various exercises to try.

The first part introduces the

basics, how to use the supplied startup code, and then the Amiga hardware in general, discussing Interrupts, DMA and the hardware registers themselves. You then go on to learn about programming the Copper co-processor, dealing with the mouse and keyboard, and information on interrupts and audio. I had difficulty getting a lot of the examples to work on an A4000/030, with some of them crashing the computer, and in one unfortunate case forcing a re-validation of one of my drives. Further investigation into the examples revealed some rather unfortunate programming techniques, which were causing some problems.

Disk 2 is dedicated to display,

bitplanes and screen organisation. Again, I had serious difficulty getting the examples to work, mostly because of the interrupt allocation technique used (take without asking). There are certainly some excellent general techniques explained though, for special effects such as flipping and melting the screen. Dual playfields are

also explained, but HAM, Interlacing and Extra Halfbright are not.

Disk 3 deals with sprites, the blitter, showing text on the screen. and scroll texts. The sprites section covers some very clever techniques joining sprites, 16-colour sprites, collision detection, and using a whole load of them to show starfields and other neat things. Most of these examples ran okay, although none of the scroll text demos worked for me. I had corrupted graphics on them all (most appeared to be screen modulo related). The AGA chipset is not detailed, which makes this guide effectively outdated, nor are some more advanced display techniques which is a good thing: with some ECS screen registers, it's now possible to actually damage your monitor by setting up impossible displays.

The guide is certainly clearly written and well organised. As for the content... well, if you're serious about learning to program the Amiga, this really isn't the way to do it. Many of the programming techniques are very risky, and a considerable proportion of them are totally illegal. Accessing the hardware directly is widely used in writing games or demos, but, if you are going to do it, do it properly. Guidelines are in the Commodore Rom Kernel Guides. There are certain things you simply don't have to break the rules to do. such as working with Interrupts. memory access, and the blitter. You don't actually have to disable the operating system to prevent it taking precious processing time. However, if your heart is set on writing whizzy

demos (despite the saturated demo market), and you're not fussed if they only work on a handful of machines, then I guess this is a pretty easy-to-follow way of learning how. Just be warned: when you start serious programming, be ready to do several months of un-learning.

Toby Simpson

Accessing hardware has to be done properly, and this is not properly.

Value for Money Not expensive, but not that valuable.

Overall rating

Even most demo-coders don't use most of these programming practices any longer, and many of the examples themselves don't work.

In use the Maiselracker replay routine supplied, the following steps must be include a Rodule into a CNIF data section of year program, using locbin-at the label int data. Call 'nt and before enabaling the VI.

Ensure OFFICH but in SMACON is set. The play repline requires use of the fludio DNA channels, but does not set this bit itself.

Call 'nt music' from within the VII handler.

When clearing the interport request but during VII handler, only clear the VERIB bit. The play restine sets us other interports and you do not want to clear any requests that may have occurred.

Stop all interrupts prior to finishing.

Call 'nt and' after stopping interrupts. ESETIFFORMENICOPEN, DESCONCAS) use our settings Set address of Level 3 interrupt hundler nove . I #Bounce, She set handler address. Enable V81 interrupt | Vertical Stank Interrupt) #SETIT+INTER+VERTE, INTERECASE hove.w Wait for 1MR to be pressed

The ACC Hardware Programming Guide: examples with

easy-to-follow explanations. Shame they're a bit iffy...

CSA 12-Gauge

he CSA 12-Gauge is a blindingly-fast 68030-based accelerator for the A1200. The version reviewed came complete with a 50MHz 68030 chip, 50MHz 68882 floating point unit, 4Mb of Fast RAM, and a SCSI interface. Installation is easy: just insert it into the trap-door in the base of the A1200. To use the SCSI

option, you have to do some fiddling to get the connector installed, but you don't have to open the case and invalidate your warranty.

The MMU (Memory Management Unit) enables you to run such tools as GigaMem virtual memory (see the review on page 61) and lots of debugging tools for programming. The FPU chip makes rendering

> applications, such as Imagine, whizz along almost as fast as an A4000/040.

> The SCSI option enables you to plug in any SCSI device, including tape drives for back-ups, hard drives and CD-ROM units, Software is supplied for setting up and partitioning a hard disk, or if you have Commodore's HDToolBox you can use that instead. CSA also supply a

utility called DROM which maps your Kickstart ROM into the new Fast memory, using your MMU. This makes your machine even faster.

The board worked pretty much faultlessly. It did however adversely affect the boot-process of A1200s that already had a hard drive inside, preventing you from disabling caches and changing other A1200 bootscreen options. This could be something to do with the power load, and if you already have an internal hard drive you might be advised to try this first. Other than that, this board is excellent. It's quite expensive, but bearing in mind that it is well over twice as fast as an A4000/030,

includes 4Mb of very very fast RAM 000000 SHOPPING LIST CSA 12-Gauge accelerator for the A1200£799 Without 68882 floating point unit:

24 HOUR SERVICE

You bet it can!

Andy Nuttall tests the new AGA version of CanDo, the "authoring package" that makes it easy to create multimedia presentations.

ultimedia is the future - graphic images, animation, film, sound effects, music, all rolled into one. CanDo is here now, and it's an "authoring package" which enables you to create multimedia presentations on your A1200 or A4000.

CanDo presentations are called Decks, because they are made up from a number of Cards - single windows you can set up in different ways: you can use them to display information, either graphics or text; or you can include buttons which offer the user a number of choices. The contents page of a CanDo encyclopaedia would list the subjects and page numbers, with a separate button for each which the reader could press to access the page.

Other buttons could offer options to expand on specific parts of the subject.

You could also create an adventure game, where the player presses different buttons to move around the game or interact with characters. The CanDo Cards could be set up to display pictures of the game area, to run an animation, or to play

sound effects. If you have access to a video digitiser, you could even give people a guided tour of your house.

You even have the capability to create arcade-style games. A version of Tetris wouldn't be too difficult to knock up in a couple of days, while the odd puzzle game is supplied to give you an idea of what you can do.

CARD SHARP

A CanDo Card starts out as a background, and you can either design this yourself or use one of the many backgrounds supplied with the package. Images created by external packages can be imported into the backgrounds, so you can even use digitised pictures. The colours used throughout the design stage depend on the particular mode you're using -CanDo AGA makes use of all fullcolour AGA modes.

You can place on the background a number of Objects, which can

either be used to receive data or to display information - buttons and menus enable the end user to do something with your project, while a simple text box is a good way of telling the user what to do. The Card is simply a container for Objects you put in as many as you like.

Creating a button is easy. Simply open a background window, click on Button, move a set of crosshairs over the background and click your mouse where you want the button to go. Determine its size and colour, then check which type of border you require (sunken, raised, embossed you're given a number of choices). You can then test it out using the Browse option, and make sure it. registers when you click on it with your mouse. Going back into edit mode, you can attach a label to it in

CanDo comes with examples which we call functional, rather than graphical, such as this calendar.

any font, and tell CanDo which card to jump to, or which program to launch, when the button is pushed.

As well as buttons, CanDo enables you to create Workbench-like pull-down menus, along with smaller sub-menus if your application needs them. When you begin to create menus, things begin to look a little complicated - because you have a menu bar at the top of the screen which you've created, and one at the bottom of the screen which belongs to CanDo and is used as part of the editor. But CanDo is laid out very well, with a clear use of colour.

Other Objects can be set up to play sounds, display error messages, launch an ARexx script, run an animation - even to read the input of a joystick or mouse. You can create windows, fields, memos - even a timer to launch a script at a particular time of day.

Using the main editing screen in

this way is the most obvious, and certainly the easiest. method of creating presentations in CanDo. As in most

programming construction kits. creating projects using the graphical editor produces a separate script file, which CanDo then uses to run your project.

The script file is structured in a very similar way to a high-level programming language such as C. Pascal or ARexx. As you add in buttons, menus and other objects. CanDo modifies the script file accordingly. If you happen to be conversant with high-level languages, CanDo enables you to get in and write your own script files from scratch, bypassing the graphical editor altogether.

While hardened programmers will relish this prospect, it's a good idea for novices to stick to the main editor only - it's a damn sight easier, it's difficult to make mistakes, and debugging a CanDo script file is not easy. If you do want to get your fingers dirty. CanDo has the tools to help (see page 68 for details).

USEFUL UTILITIES

When you've created your project, you can run it directly from the CanDo editing screen. Clicking on the Browse button takes control from the editor and into your application to check that it's running correctly. This is necessary for debugging, because no matter how careful you've been, you'll always get at least one gremlin in your system. When you're satisfied it's bug-free, you can use one of the several utilities supplied to make your application stand-alone (that is,

to enable it to run without the main CanDo program).

TheBinder takes your project and integrates (binds) it with an executable file called DeckRunner, The result is a tool which, when executed, will locate all the graphics and sound files you included, and load them into memory. Another program

Okay, so it's a little on the nepotistic side; but you get a basic idea of what can be done with CanDo.

called MultiBinder integrates your project, DeckRunner and all the associated files into one tool - which saves the hassle of a large number of files in your final application. You can then put your project on a disk and distribute it to your friends!

Other useful utilities are: ThePrinter, which prints out the contents of a deck, along with information about objects and scripts; AnimManager, which runs via ARexx to control and play full-screen animations; and TheRelocator, which automatically changes scripts when you move associated graphics and sound files to a different path. This saves you having to go through scripts step-by-step changing path names whenever you move a file.

DOES IT DO?

Both the CanDo program and the manual are obviously geared towards the complete beginner. This is just as well, really, because the projects that most people will create with CanDo will be used by beginners.

It's a cliché, but CanDo will grow with you - it can be as complicated or as simple as you need it to be. If you want to create a simple noticeboard to display text, that's easy; if you want to add in graphics, sounds and so on, that's easy too. If you want to create a thousand-page encyclopedia, with colourful pictures and reams of informative text - well, it might not be easy to produce, but CanDo will help you all the way.

As you would expect, CanDo runs

CanDo applications are called Decks, which are made up of Cards. Our Shopper Guide has three Cards.

superbly on an A4000 - menus and functions are lightning quick. It also runs happily on an unexpanded A1200, although you do need a hard drive to run it. One bizarre point regards an apparent bug in the Amiga operating system. When you first install CanDo to your hard drive and launch it, an Out Of Memory error occurs. With 6Mb of RAM free, this not an easy one to explain! However, it can be corrected by simply loading up the ScreenMode function in the Prefs drawer of Workbench, and then clicking on Save. Strange, but this corrects the fault - and then you won't need to do it again unless you need to re-install the software.

It's worth noting that although CanDo v2.51 is AGA-orientated, it does work on Workbench 2 machines but without the benefits of AGA modes. It does not work with Workbench 1.3 or earlier.

CanDo really is incredibly simple to use. The example files and manual tutorials go through the Deck creation process step-by-step, covering all aspects of objects and cards, so you'll need to spend a good few hours following certain

portions of the manual before you start. Shock! Horror! Yes, you'll need to refer to the manual a lot while you're using CanDo, and it's a big tome, too, Trouble is, it's geared towards version 2 of CanDo, and because the layout and general look of v2.51 is markedly different from the earlier version there might be some

problems matching the manual to the screen.

Any other niggles? Only a couple. With CanDo 1.5 you could play sound samples, and sequence them together using a script file. This version of CanDo enables you to load and play MED tracker files, with which you can create four-channel music using samples and link them with your CanDo project. MED also enables you to link CanDo up to external MIDI instruments – but what about a link to MIDI sequences from, say, Bars and Pipes Professional?

Given that CanDo is capable of producing some stunning graphical presentations, is this not a glaring omission?

Also, the package now supports
Compugraphic and colour proportional fonts, but it doesn't support them in every function. For example, a Memo box will only accept

The main screen uses clear icons to create an intuitive interface that even an idiot could understand.

standard Amiga bitmap fonts, whereas a button will quite happily load in any type. This inconsistency is very irritating, and forces you on more than one occasion to display messages in the form of a button.

For the Amiga user wanting to create presentations, applications or educational tools, CanDo takes away all the programming headaches, leaving you to get your creative juices flowing and actually make something quickly and easily. CanDo AGA joins a long list of multimedia creation programs, including Hyperbook, Picture Book, and the previous CanDo incarnations. It offers A1200 and A4000 owners a creative tool which makes use of all the new AGA modes, all colours with all resolutions, adding up to a powerful piece of software.

CHECKOUT CANDO V2.51 AGA

Features

CanDo can do just about anything you need for the perfect presentation in any AGA mode. The MED player addition is good, but it could do with a sequencer file player as well to enable you to make more complex presentations using MIDI

instruments.

An excellent manual, well laid out, great as a teaching aid and as a complete reference guide. Problem is, it's geared towards an earlier version of CanDo, and things have changed – especially in

Ease of Use

it. In large, friendly letters.

the tutorials.

This one's got *intuitive* written all over

Performance

A little slow occasionally on an unexpanded A1200. Got an A4000? You'll be laughing.

Value for Money

150 quid's a lot of money, but compared to multimedia authoring packages on other machines CanDo's the equal of most, and better than

Overall rating

some.

features.

The best multimedia authoring package on the Amiga just got better. It needs a hard drive to run, but then if you're serious about your Amiga you'll need one sooner or later anyway. As the AGA machines grow in popularity, it's great to see packages like CanDo extended to encompass the new machines'

The Memo Editor is used to display text in any colour or form, but doesn't support proportional fonts. Why?

TOOLS

CanDo's script editor gives you the chance to get right into the code of multimedia authoring, bypassing the graphical front-end. If you want to get your hands dirty but you're not technically-minded, INOVAtronics have included a number of tools which take some of the slog out of that heavy programming...

- ARexx Enables CanDo to communicate with other ARexxcompatible programs via the Amiga's ARexx ports. This can be used to launch other programs from within CanDo, and transfer data between the two.
- BrushAnim Deluxe Paint III and IV
 BrushAnims can be played, moved
 and controlled from within CanDo.
 The animation is loaded into a

buffer, then the velocity, acceleration and position of the animation are entered – then just press the ShowBrushAnim tool.

- Bugbasher Click on this to perform a thorough syntax check of your CanDo script – it even checks for inappropriate keywords and missing quotes. There is also a simpler VerifyScript command which just checks for typing mistakes.
- DOS The DOS Editor tool enables
 you to run another program from
 within CanDo by providing you with a
 file requester. You then choose the
 program to be run, and the tool
 creates a DOS command which
 executes the file directly from the
 script.
- Field A field can be used to obtain information from the user of your finished project. With the Field
 Editor tool you can easily edit the position, size and look of the fields
- Paint The Paint Editor tool acts like a basic paint program. Using the paint functions, you can draw in the selected window, and CanDo will create the appropriate script commands. Beware though – if you draw a complex picture, the script can become pretty large...
- Picture if you need to locate and load an image file from a script, the Picture tool is the easy way to do it.
 CanDo's file requester opens to enable you to find a picture, and the tool does the rest.
- . Sound This is multimedia, after

all. Of course you can play sounds, which must be in the form of IFF samples - the 8VSX type which most Amiga samplers save out.

SoundSequence A

SoundSequence can be created in the form of a Document, a text file which contains a list of the sounds to be played in sequence. You can create more than one Document and launch them at different times during your presentation.

• Text When you have your CanDo window set up, the Text icon enables you to position text in it quickly and easily. Type the text into the Text Requester, then use the mouse to position it in your window, and – yes, you guessed it – CanDo creates the necessary script.

CHECKOUT THE MUSIC LIBRARIAN

Documentation 0000000000000

Truly dreadful manual, which takes a number of reads before you can get it straight in your head. Presenting information in alphabetical order is not a sure way to be understood.

Ease of Use

00000000000 However, despite the manual's faults, it's not difficult to get up and running straight away.

Value for Money

8 8 8 8 8 8 8 8 8 8 Not bad for the amount of flexibility this program offers.

Overall rating

A very useful program, although it must be said that it has somewhat limited appeal. You could feasibly turn it to other tasks, but there are better dedicated database programs if you want to create your own type of database. The integration of other types of file, and cross-referencing abilities, save it from being a rather limited and pointless release.

he Music Librarian is a database program specially for handling a large music collection. It offers a way of managing information on collections of music, be they CDs, LPs, tapes or video cassettes. Each file, known as a record, contains information about a particular musical medium, and gives you instant information on the recording artist, tracks on the album or CD, release date, catalogue number and other related information.

What makes it even more useful is the way you can link records of one type to another. Using External and Internal Pointers, records can be linked to other user databases within the program - so you might attach the record of a musical instrument to

The Music Librarian

the record of a track it's used on, as well as a biography of the composer.

Even more powerful is the integration of other file types. For example, you can present IFF pictures. ASCII text files, and

even 8SVX samples from within the database. The possibilities here are very exciting - imagine being able to bring up a CD's file, see the album cover and hear the first few bars of music, all from the one program.

The program is not difficult to use, although if you have a floppybased system I'd seriously advise

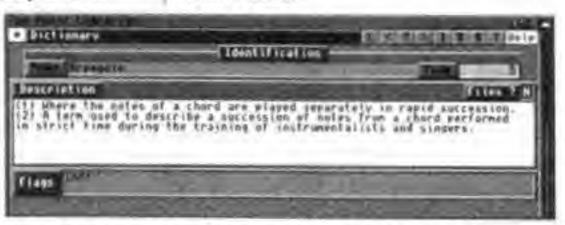

against it. I didn't once manage to get the program working properly running from floppy, and I tried on three different Amigas. On hard drive it's fine. My only reservations about the software is

Cross referencing your music library is a doddle with The Music Librarian.

its overall usefulness. How many people are going to want such specific facilities from a database? Still, there is a lot of flexibility built in to the program, and if you are looking for some way of cataloguing a vast collection, you need look no further than The Music Librarian.

Tim Tucker

You can include definitions or explanatory notes, perhaps to go with a feature on a favourite composer.

ooks and magazines can help when you're learning the ins and outs of computer-generated

music, especially since so many of the manuals are so badly written. However, given that the best way to

CHECKOUT THE MAGIC OF MUSIC AND MIDI VIDEO

Presentation

00000000 The diagrams are awful, and some important concepts are described but not actually shown. Even reading text out loud doesn't make it any clearer.

Information content

8668800000 A lot of ground is covered, and a good deal of Amiga software demonstrated, but too often the explanations are unclear and confusing.

Value for Money

000000000 Really only watchable once, after which you'll be using it to tape East Enders.

Overall rating

The lack of depth, gaping omissions, and some vague explanations ensure that you won't find all the answers to your music-related questions here. In fact, it's more likely to throw up some new ones you hadn't even considered. Best thought of as a way of seeing what's possible, but you're unlikely to watch it more than once.

The Magic of Music and MIDI video

explain almost any subject is visually, video clearly holds the key. Razza's latest, The Magic of Music and MIDI, not only covers the hard facts about computers and music, it also does it entirely from the perspective of the Amiga.

The video covers all three areas in which your Amiga can be used to produce music - using the Amiga's own internal sound chip as a synthesizer, using the Amiga to digitally sample sounds, and using the Amiga at the heart of a MIDI sequencing system. During the onehour presentation a variety of the most popular music programs on the Amiga are used to give examples. including Dr T's Tiger Cub, Blue Ribbon Soundworks' Bars and Pipes Professional and SuperJam, the Audio Master IV sampling package, Deluxe Music Construction Set and Sonix. By seeing what each of these can do and how they do it, you can see what might suit your own needs.

An hour isn't long enough to go into much detail on all the subjects

000000000 SHOPPING LIST

The Magic of Music and MIDI Video £12.99

covered, and all credit to Razza for giving a broad range of information. However, although those involved and interviewed clearly know their subjects, their explanations are very badly communicated. The subject of MIDI suffers the most, with particularly atrocious diagrams. Someone's got Deluxe Paint and thought it would be useful, but a mouse user's handwriting is not the easiest to read. The chance to use practical examples is criminally neglected in favour of shots of someone aimlessly pushing a mouse around a sequencer's main screen,

and the coverage of MIDI inputs and outputs is baffling. It's nice to see the famed American enthusiasm shining through, but the claim that MIDI offers "complete satisfaction instantaneously" is a little far fetched.

Too often the video lingers on the obvious, rather than explaining the intricacies. Three times we are treated to the secret of plugging a microphone into the socket marked

Microphone on a sampling cartridge, but never do we see where a MIDI interface plugs in to the back of an Amiga and how it should be attached to external equipment. In the section on the printing of musical scores, we see the incredible advancements of printer technology, but not what printed music actually looks like.

The best this video offers is an introduction and a guide to what's possible. But if you want useful, usable information you'll have to go back to old-fashioned books - and a subscription to Amiga Shopper.

Tim Tucker

The Magic of Music is a useful introduction, but rather than answering questions it might throw up new ones.

This stop for music

etting up a MIDI system with your Amiga usually requires some peripheral equipment. An external

MIDI keyboard with built-in sounds is the simplest set-up, and possibly a separate tone module for accessing more sounds. You'll also need a MIDI interface to attach to your computer so that all your bits of kit can communicate with each other, and a mixer to enable you to hear the separate sound sources playing together. Before long, your bedroom or work area starts to get a little cluttered. In recent times, the concept of desk top music has crept into the home computer music

versions of tone
modules are being
brought out all the
time, enabling
musicians – or just
people who wish to
integrate music into
a multi-media
environment on the
Amiga – to work
with equipment with

great flexibility but which doesn't take up too much work space.

The idea of having a totally integrated multi-media workstation is highly appealing, and nobody has done more to further the cause on the Amiga than Blue Ribbon Soundworks. Highly powerful music programs, such as SuperJam and Bars and Pipes Professional, have been carefully designed to enable the integration of almost any facet of the Amiga's many capabilities, including graphic art, animation, desktop video and of course sound

The One-Stop Music Shop offers quality synth sounds from within your Amiga. Tim Tucker checks it out.

effects and music. The same company has just gone one step further and introduced the ultimate in musical hardware integration – The One-Stop Music Shop.

The One-Stop Music Shop is a card containing the Proteus SoundEngine synthesizer module from E-mu Systems Inc., so in essence it contains many of the same sound capabilities as the family of synths based on the highly popular Proteus range, widely used in professional circles all round the

The One-Stop Music Shop is like having an entire synthesizer sitting inside your Amiga ready to play.

world. The card sits inside the Amiga 1500, 2000, 3000 and 4000, and thus enables you to have an entire synthesizer available to you without using up any valuable desk space.

Installing the card is not difficult, just requiring you to take off the outer casing and push the card into one of the available card slots. If you've never done this before, it's much easier than it sounds, and once it's done the card can be just treated as part of the Amiga. The only evidence of its existence are three new ports on the back of the

Amiga – two RCA jacks, exactly like the ones which already sit on the back panel of your Amiga and which take the audio out of the sound card; and a new MIDI port which directly accesses the One-Stop Music Shop synthesizer. The great thing about the extra MIDI port is that it enables the use of 32 channels of MIDI, if you're using the card in conjunction with Bars and Pipes Professional, because you can still attach a normal MIDI interface to the Amiga's serial port as well. More on this later.

SOFTWARE

Accompanying the hardware is a program disk containing The One-Stop Music Shop's software tools, essential for making the card accessible to the user. The simplest way to use the system is to load up the LoopBack program and connect a MIDI lead from the MIDI Out of a keyboard to the MIDI In of The One-Stop Music Shop. This effectively turns the Amiga into a synthesizer tone module, enabling you to play music on your keyboard and trigger the internal sounds on the card. The individual sounds are organised into two banks of pre-sets containing 192 sounds, which conform to the General MIDI specification (see box for information). All the sounds you need are available, from piano, strings, brass and guitar to drums and percussion.

Most of the sounds are handled very well by the card. There's a good variety of pianos, from the full-bodied concert model to the tinny honky tonk, as well as other excellent keyboard instruments, including a superb funky-sounding clavinet, rich and full-bodied organs (oooer), and a delightfully baroque harpsichord preset. The guitars are noteworthy for actually sounding reminiscent of the real thing, rare on synthesizers, and the strings are truly wonderful, highly usable washes of sound. The brass instruments are slightly weedy, but can be layered on top of each other in a sequencer to great effect, and there are some useful choir and pad sounds to add the required ambience to your music. Unfortunately, there are no built-in effects in the synth, which is a shame - it's something which every synth worth its salt features these days. The extra cost of including them may not have been justified, and there are a lot of very good value reverb units available these days, but it does rather defeat the object of an integrated system to have to resort to outboard effects.

Perhaps the weakest area of the sound card is the bass and drums side. There's nothing terrible here, but the punch and bottom end demanded by today's dance music is sadly missing from the pre-sets. Still, don't let that put you off – it's rare for a synth at this price to shine in this department, and it's certainly possible, with the wide range of sounds available on the card, to produce music in any style you want. The convenience of having the card sit comfortably in your Amiga must

GENERAL MIDI

The One-Stop Music Shop's sounds are organised according to the General MIDI specification.

General MIDI is a relatively recent introduction to

the MIDI world. It solves the problem which many MIDI users were encountering, whereby the music created on one synthesizer is not necessarily compatible with the instrument layout on another. For example, one synth might have a piano sound assigned to a certain program change number (a MIDI command which instantly brings up a pre-set sound on your synth), whereas another may have a harmonica. The result was that whenever you tried to play a song

created on one synth through another, all the instruments could come out tragically wrong, and it would take a good deal of time trying to set the new synth up to play the same instruments on the

same channels as the other. Now any General MIDI compatible synth will allocate each instrument type to exactly the same program

The MIDI File player makes it easy to load up any General-MIDI-compatible files and hear them played immediately.

change numbers. For example, sending program change number 16 to a General MIDI synth will always bring up a Vibraphone sound. Obviously, the sounds aren't identical, because each synth has a

different sound-producing architecture, but you can be sure that the music will come out sounding as close as possible to the way you recorded it.

Another advantage of General MIDI compatibility is the possibility of playing General MIDI files. These are songs and musical pieces written specifically with General MIDI in mind, and they enable you to simply load them into your sequencer, or the stand-alone MIDI File player which comes as part of the One-Stop Music Shop package, and hear them play back. The MIDI file player is also ARexx compatible, so you can issue instructions for it to load and play

various pieces of music using ARexx scripts generated by other ARexx compatible programs. This is very useful if you want to use other people's music in your multi-media productions.

CLOSE TO THE EDIT

You are not just limited to the pre-set sounds inside the One-Stop Music Shop. A software editor is provided which enables you to edit many aspects of the sounds to create your very own pre-sets. If you've never edited synth sounds before, have no fear - the process is made a lot simpler using the software editor. Instead of you having to wade through lots of incomprehensible numbers and data fields, the editor presents the Information using sliders and graphical representations of

envelopes which you can manipulate with the mouse. Even if you don't know what you're doing, you can easily muck around with the on-screen controls and see what you come up with. It's an ideal way to learn the fundamentals of synthesizer sound design.

If you do extensively edit the sounds on the card, you may well find that it is no longer General MIDI compatible. For example, if you edit the piano sound to such a degree that it sounds more like a trumpet, then any General MIDI files which call up the piano won't

Mane: Str Enumbl 2 LFO I - COME - DEA Rev-Velocity Ctl Realtime Ctl Biscellaneous G18 Hish Hote: Attack Time: 20 Sustain Level: Coarse Tune: l'ine Tune: Sound Stants Delay: 1

The editing software provided makes creating your own custom sounds a breeze - but they won't be played back the same way on another synth.

> sound correct. You can save edited sounds to disk, and load them whenever you need them, so you can always keep the General MIDI side of the synth on power-up.

On the other hand, you can save your edited banks as defaults, so that the card boots up exactly as you want it. This flexibility is a very powerful element of the One-Stop Music Shop and, especially with a hard drive, can make the accessing of edited sounds for different pieces of music an awful lot easier than with an external piece of MIDI equipment.

not be belittled, and it brings the ideal of a totally integrated multimedia environment closer to reality.

If you're looking for a new synth to add to your collection, this may not necessarily be the answer. There are hundreds of tone modules and rack-mountable synth expanders which can do the same task, and other synths may well offer more appropriate sounds for your kind of music. What this does offer is the

convenience of being able to access top-quality synth sounds from within your Amiga, making the concept of integrated desktop multi-media a real possibility. In conjunction with the Bars and Pipes Professional sequencer it becomes even more powerful, offering the only current Amiga system which enables you to access more than the standard 16 MIDI channels - a major step forward in making music on the Amiga. potential.

Considered on its own, it provides no more than a normal synth module with the added convenience of sitting inside your Amiga, Integrated with Bars and Pipes Professional, it offers enormous

Documentation

An informative and well-laid-out manual. though I question the validity of starting the manual with how to edit the synth.

Installation

An easy job to do, if you're not afraid to lift the cover off your Amiga, although there's no detailed walk-through in the manual.

Value for Money

It seems a lot to pay, and there are cheaper ways of making music with your Amiga, but many of its facilities simply can't be found elsewhere.

Overall rating

An excellent system, which can transform your Amiga into an incredibly powerful workstation. Not necessarily the best sounds available at this price. but the convenience and flexibility of the system as a whole more than compensate for anything lacking in the sound department.

INTEGRATION

You can use the One-Stop Music Shop with any MIDI sequencer on your Amiga, although it does take a little fiddling about. You have to load the LoopBack program, provided with the card, before loading your sequencer. You also have to have a separate MIDI interface connected to the serial port of your Amiga, and then take the MIDI Out. from your standard MIDI interface and connect it with a MIDI lead to the MIDI in of the One-Stop Music Shop interface. You can connect a keyboard to your Amiga in the usual way by plugging a MIDI lead from the MIDI Out of your keyboard to the MIDI in of your standard MIDI interface. In essence, you're treating the card as an external

synth module which just happens to be sitting in your Amiga.

By far the best way of integration, though, is to use the card in conjunction with the same company's Bars and Pipes Professional sequencer. The floppy disk supplied with the card provides One-Stop MIDI In and Out tools and Sound Engine In and Out

There's a built-in patch slider tool which makes it easy to change selected sounds when using the One-Stop Music Shop.

All thew tools you'll need to run The One-Stop Music Shop from within Bars and Pipes Professional are provided with the card.

tools. These can be just plonked into a pipeline in any of Bars and Pipes' tracks to access the sound card, without any need for further connections - it's all done within the Amiga. It also frees up your normal MIDI interface. attached to the serial port, for sending out another 16 channels to any other external

synths, samplers and drum machines you may want to use. This effectively gives you 32 channels of MIDI - a first on the Amiga - and enables you to produce incredibly complex musical arrangements and orchestrations.

Integration with Bars and Pipes doesn't stop there, however. Software accessories are provided which enable you to bring up the sound card's software editor, change sounds on the card using an on-screen slider, and manipulate the arrangements of sounds in memory, all from within Bars and Pipes itself. This way you can simply control the sound card and sequencer all from one incredibly powerful integrated program. Superb.

Printing with a

Jeff Walker tests two programs designed to improve your Amiga printouts: TruePrint/24 and Studio.

he Amiga prints colours in 12 bits and shades of grey in 4 bits. That means it can print 4,096 colours and just 16 shades of grey, so you'll get your 256 colours out of DPaint okay (although they may not print exactly as they are on-screen) and your 16greyscale hand-scans will print

perfectly well. But without help the Amiga can't take full advantage of the latest mono and colour inkjets or 400/600 dpl laser printers. That's where TruePrint/24 and Studio Printer Software come in.

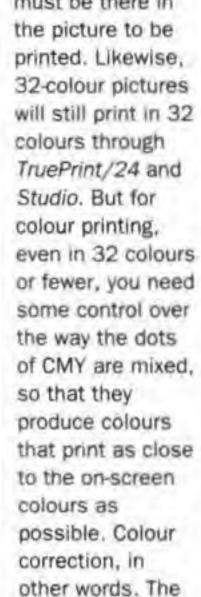

As the "24" after TruePrint will suggest, it can print pictures containing up to 24 bits of colour up to 16.8 million colours - instead of the standard Amiga 12 bits. The same is true of Studio, Both programs achieve this remarkable feat by relieving

the Amiga of the task and producing for themselves 256 shades of cyan, 256 shades of magenta and 256 shades of yellow; by mixing those shades together in patterns they can simulate printing up to 16.8 million colours (256 x 256 x 256).

Shades of grey contain equal levels of cyan, magenta and yellow

(CMY), so this means, for standard Amiga printouts, that because there are only 16 possible equal combinations of CMY, you can print only 16 shades of grey. TruePrint/24 and Studio both increase this to a possible 256 shades of grey. Now of course this doesn't mean that your 16-greyscale hand-scanned

> pictures are going to print in 256 shades of grey those shades must be there in the picture to be printed. Likewise, 32-colour pictures will still print in 32 colours through TruePrint/24 and Studio. But for colour printing, or fewer, you need some control over the way the dots of CMY are mixed, so that they produce colours that print as close to the on-screen colours as possible. Colour correction, in

Workbench Prefs/PrinterGfx program provides a very rudimentary colour correction facility that, thanks in part to having only 16 shades each of CMY to play with, does not work particularly well. TruePrint provides you with more power. As well as being able to adjust the brightness, contrast and

> green and blue. This is a bit of a strange system for a printing program because colours are not printed in red, green and blue, but experiment a little and you soon get the hang of it.

> Studio provides even more control over colours, and it does it in CMYK (the K stands for black). In fact, Studio provides so much control that at first you can be

you soon discover what does what. The results of printing from Studio and TruePrint/24 are fairly similar. Both do an excellent job, but I would say that the Studio printouts have the edge once you've learned how to control the beast, which means reading and re-reading the manual, experimenting a lot, and making notes. The big difference between TruePrint/24 and Studio is that TruePrint/24 can only print IFF

Requires better drivers than come with the Amiga to get the best out of it.

provided with TruePrint/24, so it will only work with printers for which you already have a printer driver. Studio also contains a picture-printing program, which is very similar indeed to TruePrint/24. But the aces up Studio's sleeve are the Amiga printer drivers that come with it, providing support for all Hewlett-Packard DeskJets and LaserJets, and most Epson-compatible 24/48/64-pin/jet printers. The Studio preferences programs provide control over page sizes, typefaces, dither patterns, colour correction, and any program that prints in the normal Amiga way (which is 99.99% of all Amiga software) is able to take advantage of the enhanced features in the 100% Amiga compatible Studio printer drivers. Or to put it another way, as well as being able to print pretty pictures itself, Studio can also enhance the output from programs like ProPage, PageStream, PageSetter, Wordworth, Final Copy, DPaint, Brilliance, and many others. Both are good; this is great. (AS)

AND SHOPPER Complete Amiga C

Everything you need to start programming in C

- Beginners book on learning to program in C
- PLUS the fully-registered version of DICE, the leading shareware C compiler
- PLUS on-disk reference and DICE documentation
- * PLUS all necessary Commodore 'includes'

A sample edition of this book is given away free with this issue of Amiga Shopper – check it out!

C is the programming language of the professionals. Indeed, much of the Amiga's operating system was written in C. And C variants exist for all major computing platforms – once you've learnt C on the Amiga you'll be able to program any leading machine.

Our aim with Complete Amiga C was not just to produce a book explaining C for beginners. We wanted to provide EVERYTHING you need. Which is why we sought out the best shareware C compiler available - DICE - and secured a deal on the full, registered version. We also negotiated with Commodore to provide all the special C libraries and includes needed to program the Amiga properly.

In short, everything you need to program your Amiga in C is right here!

f, like me, you've got both a scanner and a printer that you use every day, you've got a problem. Both need to be plugged into the parallel port, and it is a real pain having to power down In order to swap cables. A switch box won't do: my Epson GT-6500 scanner insists on being connected directly to my Amiga's parallel port. What I need is another parallel port. And that's what the MultiFaceCard

CHECKOUT MULTIFACECARD 3

Documentation

000000000 Poorly translated from the German and way too technical for beginners.

Ease of Use

Installation and initial operation are easy, but it takes a while to learn the extra intricacies of the software.

Value for Money

Well worth the cost if you want the convenience of multitasking parallel/serial port peripherals.

Overall rating

Two extra parallels and one extra serial might have been more useful than the other way around.

3 has given me.

A simple command automatically added to my user-startup fools the Amiga into using the MultiFaceCard parallel port instead of its own, and because the scanner software dives straight at the hardware to access the Amiga's parallel port I haven't got to worry about telling software which port to use; it just happens. Not having to manually swap cables saves me about an hour or two per week in computer downtime, so the board will quickly pay for itself. Heck, I can even scan and print at the same time, another time saver.

Also on the MultiFaceCard 3 are two serial ports. A 9-pin sub-D connector is mounted on the rear bracket beside the extra parallel port, and a further 25-pin standard serial port is provided on a cable and bracket that can be connected to the board and slotted into another

MultiFaceCard 3£110 By: bsc büroautomation AG, Postfach 400368, 80703 München, Germany Distributed in the UK by: MicroPACE (UK) Ltd, Unit 10, Perth Trading Estate, Perth Avenue, Slough SL1 4XX □ 0753 551888

MultiFaceCard 3

bracket position. Alas, my A4000's Zorro slots are all spoken for, so if I want to use this extra serial port I will have to let the cable dangle loose out the back of the machine somehow. This will be less of a problem with the A1500/2000 of course because it has seven bracket positions.

Workbench 2.04 is a minimum requirement for the MultiFaceCard 3 software. If you are using Workbench 2.1 or better the software will install DosDrivers, otherwise it'll provide a file of mountlist definitions for you to use with the Mount command.

For controlling the extra ports there's just the one small CLI command, MapDevice, which is the aforementioned program that fools the Amiga into using the MultiFaceCard ports instead of the

Amiga ones. In effect the MapDevice command is used to switch output between ports, although it is far more sophisticated than this. The serial ports have a special preferences program so that the baud rate (up to 115,200) and

other protocols can be set. A special version of the ParNet networking software is included so that you can network two or more Amigas via the MultiFaceCard parallel ports instead of the standard Amiga parallel ports. The manual details the pinouts for the cable you will need to make.

Because the manual serves all versions of the MultiFaceCard and the SerialMaster board as well, it is a little confusing to say the least. But fortunately the MultiFaceCard 3 hardware and software are pretty simple to install. I was up and running with the extra parallel port in 15 minutes, although I think the serial ports and networking will take longer to master. And if you're into programming, developer notes and autodocs are provided.

Jeff Walker

Always wanted another parallel port? MultiFaceCard 3 can give it to you, plus serial ports, and networking!

Ifa Data products have a reputation for being well-made and reliable, and this new mouse and switcher live up to that reputation.

The mouse boasts ultra-high 400 dot per inch resolution - great for graphics or detailed drawing. The micro-switches too are of a very high quality, with a clean crisp click when you make a selection. There are a healthy five feet of cable, terminating

0000000

Alfa Data Megamouse £14.95 Mouse/Joystick Switcher .. £12.95 From: Golden Image, Unit 12A, Millmead Industrial Estate, Millmead Road, London N17 NQU **= 081 365 1102**

and resistors. There are two LEDs. one green and one red, which indicate which you have selected, mouse or joystick.

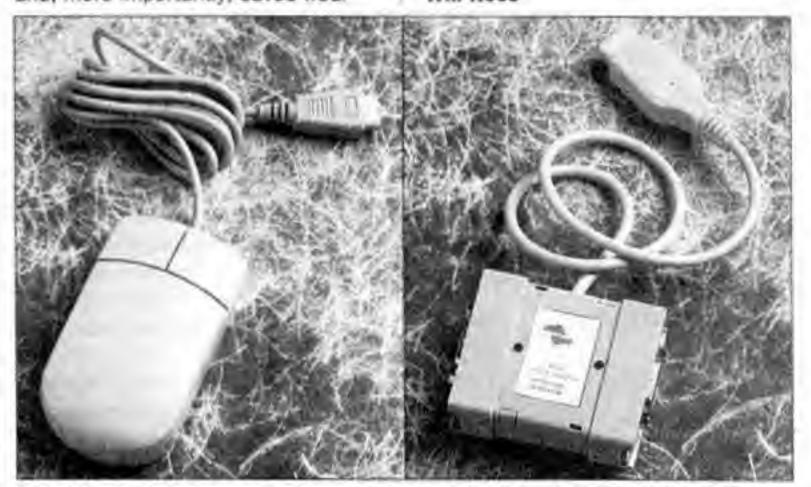

You simply plug mouse into one port and joystick into the other, then the cable into the appropriate port. The unit detects which device you want to use as soon as you press the left mouse button.

It works faultlessly, and adds a new dimension of speed and convenience to multi-player games and, more importantly, saves wear

and tear on the delicate connectors that you'd otherwise be putting at risk by repeated plugging-in and unplugging of leads.

I like both of these units so much I have ordered them. Take my advice, if a new mouse is on your shopping list and you want the added convenience of not having to struggle behind your Amiga amidst the plethora of leads and connectors, buy them both - they are absolutely first class.

Wilf Rees

The Alfa Data Megamouse and switcher look fairly ordinary. But this is by a long way the best mouse I have ever used on either my Amiga or PC. Both pieces of kit for under £28 must be one of the best bargains this Christmas.

Alfa Power hard drive

pe hard drives are often frowned upon, but in fact IDE has a major advantage over SCSI – IDE drives and controllers are much cheaper.

For this reason, AlfaData chose IDE for a range of budget hard drives to market alongside their existing SCSI units. One or two drives can be mounted inside the thin steel case, relying on the Amiga for power and a

The Alfa Power - a budget IDE-system hard drive, with some corners cut but a respectable turn of speed.

draughty room for cooling.

Is this such a bad thing?
Commodore recommend that all peripherals have their own power supply and experts would argue the case for cooling DRAM – which tends to develop permanent amnesia if it gets too hot. A fan is not available, but the extra PSU (recommended if RAM is fitted) should be considered at £39.95 extra. The RAM expansion

- using ZIPs - can accept up to 8Mb in total; nothing less than you should expect from a modern design. However, lack of a fan may shorten the lifespan of these expensive modules (£69 per 2Mb).

Software supplied includes a formatter and memory test utilities. At first glance, they look cheap – but few will find them a problem in practice.

Documentation in German and English is set in the next

point size up from microfiche: myopic buyers will have to resort to magnifying glasses. The translation is similarly average, but things go smoothly once you adjust.

On the down side, the attractive case has two tempting switches mounted right in harm's way.

Respectively these enable the RAM and hard disk – effectively making a game switch. (Does anyone need these things now?) Although they're not easy to catch, little fingers could crash the machine or cause strange boot failures. Not a major criticism, but one to be aware of.

AlfaData have cut a number of comers to bring hard drives to the masses and you might be forgiven for thinking these would lose in terms of speed too. Surprisingly, quite the opposite is true and once the tedious process of formatting

and configuration has been completed, the drive nips along at a respectable speed, though it's no GVP Impact. Pound for pound, the Alfa Power hard drive could be compared to the KCS dual-density, double-decker floppy drive that has a guaranteed capacity of 4Mb at around the same price (see opposite page). Think of that and you have a very cost-effective solution.

Mark Smiddy

works well.

Speed Speed Respectable, if nothing to write home about. Ease of Use Software doesn't look pretty – but it

Construction

Solid – especially considering the low price.

Value for Money

Cheap, cost effective and simple.

Overall rating

Probably the best budget drive around.

Reference hard drive

o compete in the overcrowded A500-compatible hard drive market, any new model has to be cheaper, faster or otherwise better than the competition. The Reference, a SCSI-DMA design inside a tough steel case, at least looks hardier.

From there on though, things start to go downhill at an alarming rate. The separate "dumb" power module has to be switched on before
the Amiga, thus allowing the drive a
few seconds to spin-up and, more
importantly, ensuring that the
interface is present on the bus
before the Autoconfig kicks in. The
upshot is that you have an extra
supply to turn on or off in the correct
sequence or the Amiga will crash. As
far back as the original Commodore
A590, most designs have had a
remote control PSU switched on

when the Amiga comes on line. Also, just like the A590, the Reference's cooling fan coupled with the drive make a very noisy combination.

Supplied software includes a backup system, a low-level formatter that looks like something from the dark ages of CP/M, and one of the worst pieces of set-up software I have ever seen. Quite what possessed anyone to use inovatronics CanDo 1.6 is

beyond me. The software is not only slow and clumsy, but ugly beyond compare. The wild mixture of palette and styles would make Picasso blush and, more importantly, is almost unreadable on even a decent monitor. If that were not bad enough the low-level formatter proved unreliable, crashing the RDB on more than one occasion, meaning the whole process had to be repeated.

In use the drive proved generally unreliable when started from cold – although it worked well when running normally. All this could be forgiven if the Reference could claim to something in the speed stakes – but it fell short here too, in spite of the 100Mb hard drive which would normally give it an advantage over smaller units.

Like most modern expansions, the Reference is designed to accept extra memory – up to 4Mb. In light of

this Evesham recommend the use of their own Autoconfig memory expansion. This is weak and highly inconvenient too. The complete (8Mb) Fast expansion really should be on the controller if the Reference were to be a serious competitor; it isn't. It may be tough, but little else can be said about this hotch-potch other than to ask if it is going to make any mark in the market at all. Mark Smiddy

Speed

Not particularly outstanding.

Ease of Use

Set-up software is temperamental and

not for beginners.

Construction

Among the toughest boxes to date.

Value for Money

It's cheap certainly, but doesn't offer

much for the money.

Overall rating

Think carefully and consider the other alternatives.

The Reference hard drive for the A500 - It's tough but noisy, and the external "dumb" PSU is troublesome.

Drive to destruction

Mark Smiddy examines the KCS dual highdensity disk drive - all hype, or the best thing since the non-stick frying pan?

n the launch issue of Amiga Shopper I was charged with the task of choosing a drive for all seasons. Given that all Amiga drives are based on a rigid electronic standard, there is little to separate them. To resolve this, a specially-designed series of tests subjected the mechanisms to a variety of extreme physical and environmental stresses.

Three years later, little has changed. Most Amigas are still fitted with a limited double-density drive and the hardware is incapable of supporting the universally accepted high-density (HD) standard found on other platforms.

Power Computing were the first with an answer - the XL HD drive (reviewed in Amiga Shopper 29 - see page 106 if you want to order a copy). But what's the use of a standard that isn't supported by the vast majority of Amigas? Two uses come to mind; first, backing up a hard disk will require fewer disks (although there is little saving in cost terms) and second, it allows you to read and write high-density PC disks.

Netherlands-based Kolff Computer Supplies, best known in the Amiga community for their ground-breaking Power PC board. have now also addressed the problem, and come up with some

interesting solutions. Their dual HD drive has been on the cards for a long time - but it was worth the wait.

A clever marriage of intelligent software and ingenious hardware results in a double-decker drive that's not only measurably faster than any comparable mechanism, but brings a Workbench-3-like filing system to every machine running Kickstart 1.3-plus and PC compatibility to all. Thanks to realtime compression, storage capacity is quadrupled to beyond 4Mb on an HD disk (best case) and increases the read speed an average exceeding 300% when compared to a standard machine. Counting these features, the double decker is not two drives. but eight rolled into two.

Software supplied with the unit includes a driver, installation program, replacement for the standard DiskCopy, extra drivers for the KCS Power PC card, simple hard drive backup, track display and special formatter. The formatter currently supports no less than 12 different capacities from 720K to 4Mb-plus. Plus facilities for FFS. International and DCFS filing systems - all usable on 1.2 machines! (FFS or Fast Filing System was introduced in AmigaDOS 2; Directory Cache Filing System or DCFS arrived with AmigaDOS 3 to provide faster

directory reads.) It's a pity there isn't enough room to list full details here.

PC disk compatibility is internal - so there's no need for PC-Amiga file transfer software like CrossDOS, MultiDOS or MessyDOS - and the standard hardware is compatible with Cyclone T2, Blitz and Syncro Express hardware back-up systems. The nearest competitor requires at least Kickstart 2 to work and Kickstart 3 for full functions, and cannot achieve

the speed of a standard machine.

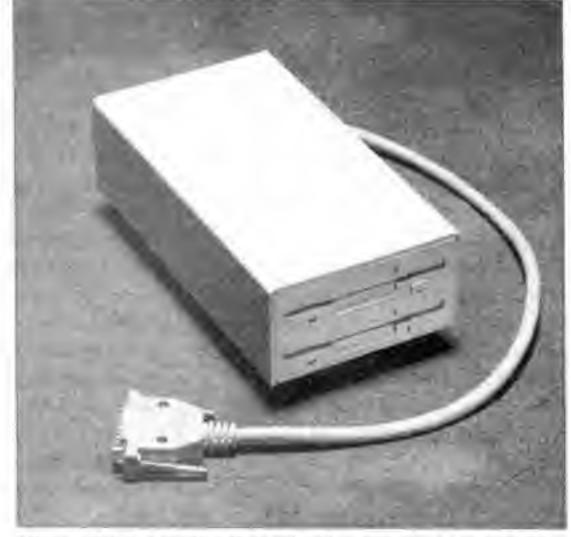

Practically speaking it is difficult. to find something the KCS system doesn't do. The software currently shipping at version 1.70 is due for upgrade before the end of 1993 and KCS promise better and faster compression with an improved hard drive backup sub-system. KCS plan to include an extra software driver to add the compression system to existing hard drive partitions effectively doubling the storage capacity of all non-boot partitions!

Also for this version will be the ability to read and write two disks as a single device (or volume) doubling the possible capacity to over 8Mb (yes, eight) for HD disks. Although it will never replace a real hard drive, this makes it an even more attractive and cost-effective solution for media-greedy applications. In this sense, it could even be compared to a small removable hard drive - slower, yes, but a lot cheaper. Last, but not least, is a replacement for the slightly tacky interim manual. All registered users get all this automatically at no extra charge.

No review would be complete without some criticism - and the

KCS Dual High-density Drive £199 By: Kolff Computer Supplies From: Bitcon Devices Ltd., 88 Bewick Road, Gateshead, Tyne & Wear NE8 1RS. # 091 490 1919

Want a high-density disk drive for your Amiga? KCS's new dual HD drive can give you two of 'em in one unit.

KCS drive is no exception. It's let down by a poorly designed plastic case and a rear-mounted mode switch that's susceptible to little fingers. Also, the inclusion of copier hardware will furrow the odd brow. I have no doubt. On the software side. it would be nice if the compressed drives appeared as a straightforward dfx: rather than CMx: - but this is a minor irritation.

The bottom line is that KCS have done for floppy drives what GVP did for hard drives, and others will be hard-pressed to better it. This is the most innovative and singularly useful product I have seen since Amiga Shopper began. Save up, sell the wife and take out a second mortgage on your granny: your Amiga is crying out for one. (33)

THE BENCHMARKS

Our tests were compiled using an extended, high-speed file copier, duplicating a mixture of 56 various length files and several directories comprising over 740K of mixed data. The KCS compressed drive timings shown for the 25MHz A3000 model, while not achievable on slower machines, are

Enough said.

Canon BJ230 bubble jet printer

ssentially, this printer is a BJ200 bubble jet with a longer platten and a wider case. That is to say, the

actual mechanics of the machine are the same but for the fact that they have been adapted to cope with a wide carriage.

This may not seem important, especially since it makes this model around £60 dearer than its little brother, but it does have potential uses. Laser printers, apart from very expensive ones, are limited to an A4 format, which makes them

The Canon BJ230 bubble jet printer - the winning combination of bubble jet quality plus a wide carriage.

particularly useless for spreadsheet work. Although most spreadsheet software has an option in the print requester to output in "landscape" format - that is, with the image sideways on the page - this means you get the width and not the height. Sure, ordinary dot matrix printers can handle wide carriage, but then you don't get laser quality resolution, which can be quite important, even on a table full of numbers.

As you would expect from a Canon bubble jet, the mechanism is quiet (you only know that it is on by

> the rustling noise the paper makes as it is sucked in), the footprint is small and the output fairly fast. You always have to take manufacturers' performance claims with a pinch of salt - it is more like three minutes per page than three pages per minute. (This isn't really the printer for people in a hurry.) At that speed it would take rather a long time to

deplete the stockpiles held in the automatic sheet feeder, which can hold up to 80 pages.

The print mechanism itself is very accurate - it seems to be of a much better quality than the original designs which appeared with the BJ10. The print quality seems to be much less dependent on the type of paper used, and with the software provided you can get a very decent range of shades.

The only real problem with the BJ230 is that if you use full carriage a lot, you are going to run out of ink a lot faster. Maybe a refill does only cost a couple of quid, but you don't really want to be fiddling around with nasty bottles of black stuff every hundred pages or so. Perhaps the time has come to start making the cartridges too just that bit bigger.

CHECKOUT CANON BJ230

Features

0000000000 Three print modes give a reasonable compromise between speed and quality. Otherwise it's the standard 360 x 360 dpi and excellent greyscales you

Documentation

would expect from a Canon BJ.

0000000000

The manual covers everything in extreme (sometimes tedious) detail, but it's always handy to have all the info.

Ease of Use

0000000

Built-in Epson emulation, and an appropriate driver is supplied.

Flexibility

6666666 Many will welcome the wide carriage.

Value for Money

0000000000

A reasonably-priced solution to the conundrum of having a wide-carriage printer with laser-quality output.

Overall rating

I'd heartily recommend a Canon bubble jet to anyone, but if you don't need the extra inches, go for the cheaper BJ200 or the more expensive BJ600c, possibly the best-value colour printer available.

Epson EPL-5000

he EPL-5000 is Epson's latest laser printer. Lasers, as any fule kno, give you much better quality results than dot matrix printers, and have the added advantage of not waking the dead with the noise.

serious work on the design of this foot high, with a panel on the front which lifts to reveal the paper tray, which can hold up to 250 sheets of A4. The paper feeds through from this and ends up on the top of the

Epson have certainly done some printer. It's about two feet long and a

Epson's EPL-5000 laser printer emulates three printers with Workbench drivers, so it's easy to get going.

printer, although you can get an optional tray which means that the paper isn't bent on its passage through the printer. This means that it can cope with thicker paper and overhead projector transparencies, which don't like being bent after printing.

The EPL-5000 can emulate three printers: the Hewlett Packard Laserjet, EpsonLX and EpsonQ. All three of these have Workbench drivers as standard, so setting up the printer shouldn't pose a problem. It comes with a parallel interface as

> standard, which includes a 32K buffer to speed up the flow of data (slightly).

Print quality from this printer is superb, with solid blacks and excellent greyscale rendering. Add a printer enhancement program such as TurboPrint or Print Studio, and the quality is even better. The maximum resolution is 300 x 300 dots

As you'd expect, working at this sort of resolution requires a lot of memory on the printer, and the half a megabyte included by default isn't really enough for full-page desktop publishing work. This can however be expanded up to a hefty 6.5Mb, which is easily enough for high-resolution full-page DTP work. Epson claim a speed of up to six pages per minute, but if you're dealing with graphics (and DTP pages are printed as graphics) this is more likely to be six minutes per page. Pure text is extremely fast, and I've got no dispute with Epson's figure once it's worked up a head of steam.

Overall, this is a very impressive printer. Laser printers are rapidly becoming more affordable, and this one certainly won't do anything to tarnish Epson's reputation. There's no option to add PostScript to this printer, although it can use Hewlett Packard expansion cards for fonts and so on. If you don't need or can't

per inch, as with most laser printers. afford PostScript, this printer is definitely worth considering. Richard Baguley

CHECKOUT EPSON EPL5000

Features

0000000000

Emulates a Hewlett Packard Laserjet IIP, EpsonFX and EpsonLQ.

Documentation

Epson's usual high standards have been maintained. Includes an excellent glossary.

Ease of Use

The included HP emulation means that you don't have to use any external drivers.

Flexibility

0000000000

tt's a good laser printer. What more do you want?

Value for Money

0000000000

Reasonably priced. Expect to see it for around £600-£700 from most retailers.

Overall rating 000000000

A good, solid printer, It's not the fastest or best laser on earth, but it's affordable and reliable.

CHECKOUT STAR LC24-30

Features

Can emulate both Epson and IBM printers, although the inclusion of Print Studio makes this somewhat unnecessary.

Documentation

Gives you all the technical gen you're likely to need, in a reasonably easy-tofind form.

Ease of Use

The Print Studio software means that it's very easy to set up.

Flexibility

The good range of fonts and built-in single sheet feeder are extremely useful.

Value for Money

The list price is £350, but expect to see it for around £300 in the shops.

Overall rating

A good, solid colour printer which looks as if it could take the knocks and can produce good results, although it's a bit noisy for my liking.

ew from Star is the LC24-30, a 24-pin colour dot matrix. It's certainly good value for money in the pounds per pound

stakes, weighing in at just under six kilograms and standing around seven inches high (not counting the sheet feeder) - so it certainly can't be described as a portable. Put it next to Star's dinky new SJ-144 and you'll see what I mean.

A single-sheet feeder is built-in, which can hold up to 55 sheets. although this does depend on the thickness of the paper. Fanfold paper can also be used, and this feeds through from the back of the printer. The control panel on the front has three buttons, using which you can load paper, change fonts, feed paper through or feed the dog.

Also included is a cut-down version of Print Studio, which includes a driver for the LC24-30. and this is very easy to install using

000000000 SHOPPING LIST

Star LC24-30£351.32

By: Star Micronics, Star House, Peregrine Business Park, Gomm Road, High Wycombe, Bucks. HP13 7DL. **= 0494 471111**

Star LC24-30

the Commodore Installer utility. This gives you a much greater degree of control over the output than a conventional Workbench printer driver, and includes a good range of dither patterns. As with all software of this type, the way to get the best results is to experiment.

The LC24-30 does have a "Quiet" mode, but it's still a noisy printer and using the Quiet mode slows down the print speed. The quality of the output is very good.

although there is a certain degree of banding on the printouts, caused by the paper being fed on the wrong distance, meaning that some strips are either printed twice or not at all. You can lessen the amount of banding by adjusting the printer, but you can't eliminate it completely.

The LC24-30 uses the normal fourcolour ribbon, and the colours are fairly good. They aren't particularly bright,

but there is a good range of tones in there, and some experimentation with the "Colour Adjustments" window of the StarPref program would improve this.

This is certainly a heavy-duty printer. It's well built, the print quality is good, and the text output is pretty fast (around 80 cps in letter mode). Unfortunately, the noise is extremely irritating, and would begin to grate after the first few pages.

Richard Baguley

The Star LC24-30 is a dot matrix with built-in colour capability, but it is noisy and certainly no lightweight.

ot matrix printers aren't exactly cutting-edge technology these days, but new models keep appearing. The latest from printer pioneers Epson is the LQ-100.

They've certainly had a rethink for this model. It's nearly completely

CHECKOUT EPSON LQ-100

Features

000000

Nothing particularly outstanding, I'm afraid.

Documentation

Up to Epson's usual high standard.

Ease of Use

Just plug it in and you're off.

Flexibility

00000 A basic, but solld, printer.

Value for Money

• • • • • • • • • • • • Aimed at the budget end of the market.

Overall rating

00000 It's certainly a reasonable printer at a reasonable price, but nothing really distinguishes it from the many others in this price bracket.

0 dot matrix printer

enclosed, with the printing area covered by a removable plastic cover, which means it's significantly quieter than your usual dot matrix printer - the normal whine is still there, but much less loud.

Paper is fed into the machine by two possible routes: either through a single-sheet slot in the bottom of the printer or from a cassette at the front which can hold up to 50 sheets. The former can also be adapted to print on continuous paper with an optional tractor feeder.

The various settings (such as which font to use and loading paper) are controlled through two buttons on the front. The usual DIP switches are not present on this model, because Epson have assumed that the printer will be mostly controlled from the computer. Unfortunately, there isn't a driver for the Amiga which takes advantage of the new

000000000

SHOPPING LIST Epson LQ-100£262.52

By: Epson UK Ltd, Compus 100, Marylands Avenue, Hemel Hempstead, Herts. HP5 7EZ ± 0442 61144

"Esc P2" control codes, but fortunately these are compatible with the standard Epson control codes used by the Workbench drivers. Unfortunately again, you're stuck with the old Workbench Epson Q driver, because Epson haven't included a Workbench driver with this printer, though it's worth trying printer enhancement programs such as TurboPrint or Studio (see page

72), which have support for some of the newer Epson Printers.

Like all 24-pin printers, the LQ-100 is capable of up to 360 dots per inch, and Epson claim a reasonable speed of 200 characters per second in draft mode. Put it into letter quality, though, and it drops significantly to around 60 cps. The text quality is very good, and seven fonts are built in to the printer.

Graphics, unfortunately, is another matter. The results are muddy, with some rather nasty banding. Some of this can be removed by careful adjustments to the paper feed mechanism, and the tonal range can be improved by using a printer enhancement program, but the quality is never going to be anywhere near what you can get with a bubble jet or inkjet printer.

The Epson LQ-100's enclosed casing muffles the noise you'd normally expect from a dot matrix printer.

Fujitsu DL1150 dot matrix printer

pins, can the dot matrix make a comeback against the bubblejet brigade? Fujitsu think it can, and if nothing else I have to say that this is possibly the best documented printer I have ever seen. Apart from the 150 pages of user manual, there is also a programmer's handbook of around 400 pages, detailing every possible function and operation that this printer could ever perform, every piece of maintenance you could ever want to do, every screw that might come loose. Okay, it is in

ow with wires instead of

German, but it looks good on the rendering of a s

The Fujitsu DL1150 dot matrix printer - well, wire printer, really - has a quite usable colour option.

bookshelf, and hey, isn't it about time you learnt a second language anyway?

A combination of fonts and styles give you a total of 15 different typefaces for text mode, although many of them are only available in the NLQ mode. Besides, a large number of resident fonts is no longer a big selling point. If you are printing out some high-speed text, it doesn't really matter what it looks like as long as you can read it, and if you are printing out a letter you'll probably be doing it through a program which uses a graphic rendering of a scalable font anyway.

If speed is your thing, the DL1150 can produce a fair 200 characters per second, but it is not the most legible draft mode I have ever encountered on a dot matrix. You will almost certainly have to splash out on some ear defenders as well perhaps I have just become too used to working with lasers and bubble jets, but the Fujitsu managed to drown out the office CD player, which is a bad sign.

There is a colour option, and it does produce surprisingly reasonable results – for a while anyway. The trouble with colour ribbon printing is that the ribbon is never long enough. The colours always migrate across the bands of the ribbon (in use, not in storage), so by the time you get to the third or fourth pass of the ribbon all the colours are brown anyway. Dot matrix printers have never been any good at colour though, so it is unfair to labour this point.

The Fujitsu DL1150 does come with the relevant Amiga drivers, so it is a very simple matter indeed to get it up and running with any software that supports a Preferences printer. There are a couple of fallback emulation modes too if you get into any difficulty.

CHECKOUT FUNTSU DL1150

Features

Reasonable 360 x 180 dot-matrix

Reasonable 360 x 180 dot-matrix output. Colour mode can give results varying from poor to quite good.

Documentation

Pretty good manual with full information on emulation modes and everything else you could expect. Shame the programmer's / maintenance handbook isn't in English...

Ease of Use

Comes with its own driver, but then it doesn't tell you how to install it. Pretty basic though.

Versatility

Okay for speed, reasonable for colour.

Value for Money

......

Far from the cheapest model on the market, but it looks as though it could outlast many of the other models (though you may go deaf).

Overall rating

A well-built, sturdy workhorse that can output decent quality pages. The colour option is quite usable if you don't use colour all the time or you are prepared to buy lots of ribbons.

Award Construction Kit

ou're kidding. I mean, if you've done something worthy of receiving an award, wouldn't you expect to be given a decent award certificate you could hang on the wall, rather than a trashy-looking printout from Award Construction Kit with pictures and words that are all jagged around the edges?

Award certificates are the kind of thing at which Professional Draw and Art Expression excel. Okay, these programs cost three times as much as Award Construction Kit, but

Brama
Award

Award

Sylvester Stallion

English Place

Sylvester Stallion

Reckon there's a demand in the Amiga market for a program that produces printouts like these?

PageSetter 3 doesn't, and it will even print at the highest resolution possible on your printer, without jaggies around the text and pictures.

The only thing ACK has going for it is ease of use. You can produce a certificate in under a minute, while in PageSetter 3 it might take five to ten minutes to import and position everything. With PageSetter 3 you don't get the range of border and text styles that come with ACK, but shareware clip art and Compugraphic fonts are not expensive, and all the art and fonts in ACK are available

other disks. ACK provides about 50 standard award topics - sports, school, family and so on - or you can make up your own. Various areas of the page are designated to take either text or a graphic. You have quite a degree of freedom over text style, and 11 omate

from EMC on

borders and five seals are provided. You choose styles and so on by number from various control panels. Dead simple. But it's all ragged round the edges. The boot sequence for the floppy doesn't even run SetPatch, just a few Echos, Setmap, LoadWB and EndCLI. Two hard drive installation scripts are provided so you can install the program on to either dh0: or dh1:. If your hard drive is called something else, you will have to do it by hand (though the manual does give step-by-step instructions). And the two installation scripts provided both automatically load sys:s/startup-sequence into Ed so you can add some Assign commands to that file. What a bloody

This is Amiga software at its very worst. It's not even up to shareware quality. There are a million better

WHITE KNIGHT TECHNOLOGY" PO BOX 2395, WALTHAM CROSS, HERTS EN8 7HQ

description Drawing by

Professional computer-aided design on the cheap? Pat McDonald looks at XCAD 2000.

ogether with a plotter or graphics printer, a CAD (Computer Aided Design) system can provide

printouts of object designs with an accuracy far superior to that of a human hand. And XCAD makes it easy as well.

You need at least 1Mb of RAM to run XCAD 2000, though a hard disk is not required. It's dongle-protected, but the dongle is only needed for certain operations like saving a drawing to disk. Interlaced display versions are included if you have the

display to make use of them, though they do run more slowly.

Run the program and you discover that it looks bloody hideous. However, you rapidly come to appreciate the fact that you asked for a professional CAD program and you got one. In its own way, it's excellent.

Although XCAD is an alphanumeric language that can be meticulously typed, practically every operation can be done with just the mouse. Input and output windows flash up and disappear, and if you just want a drawing area, you can turn the whole lot off. At first glance it looks totally word- and keydominated, but in fact XCAD is more like having someone give a running commentary on what you're up to with the mouse. It doesn't take long to stop worrying about the words and concentrate on your drawing.

Freehand artists, however, will probably still not be happy. The program is quite happy with working in miles and millionths of an inch. Or kilometres and centimetres. But XCAD 2000 uses a maximum of 16 colours - sorry, AGA owners. The picture elements are not square-

Although It may look 3D, this is a 2D perspective view of a 2D model, with hidden lines nicely removed.

edged rectangles but lines of variable thickness. Obviously scaling up and down is necessary, and with a CAD program you are absolutely dependant upon working on a grid.

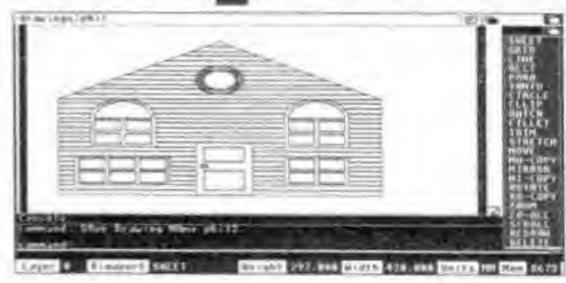

Those with an engineering or mechanical background will find XCAD much more approachable. CAD is not about producing stunning

graphics - it is about modelling objects to a degree of precision where they could be manufactured, given the technology.

So why is it better than using a

draughting board? Well, apart from the accuracy factor, there's also repetition. A human draughtsman has to draw every single nut, bolt, window frame and door knob unless they have made a stencil that they can trace. Copying bits of a drawing about on a computer is faster, and elements can also be stored on disk for later use. DM call these reusable bits of artwork "Symbols", and they have a few sets of standard items available - architectural and electronic schematic. As more people buy and use XCAD, I guess we'll see more. But the good news is, you can also import drawings and objects from AutoCAD on the PC (DXF format) via the PC-Amiga transfer utility CrossDOS. Sort of. It's not brilliantly implemented. Other output formats include Aegis Draw and Postscript, In addition, XCAD works with all Preference-supported graphics printers and HPGL, CPGL and RDGL plotters, if you are lucky enough to have access to one.

Once you have a view of a

The first tutorial, by long tradition a simple house picture. Takes about half an hour to work through.

design, you can load it into the 3D perspective modeller. It's nowhere near a true 3D rendering system, but it does let you get wireframe images (minus hidden lines) of a 3D model. You can output 3D models to Sculpt 3D and 4D. Those who wish to do a lot of work in 3D would be better off with XCAD 3000 - see the box.

This is an individual program that is ugly and not shy about it. If you persevere, you recognise XCAD's brute, solid strength. Once you have mastered the keyboard shortcuts, you can express the shapes in your head as fast as you could on paper and with extreme accuracy, Highly recommended.

But what if you want a real CAD program? One that reads DXF files much more completely than XCAD 2000 (though still not fully)? Go for XCAD 3000/ But be warned, we're talking 700 pages plus of manual. And it does cost £249.99. And it needs 2Mb of free memory.

XCAD 3000 is much more 3D orientated and can output 3D objects in Turbo Silver format - very handy

for getting accurate models into a 3D rendering package. Shame it's not AGAcompatible, but 256 colours would slow it down. The redraw on XCAD 2000 is fast. but it's not on 3000.

Why is a CAD package better for designing 3D models for rendering software like Imagine and Sculpt? Quite simply,

scale. 3D programs usually do not use real units. So getting your nuts and bolts to the right scale on an oil platform is largely guesswork. XCAD can provide the 3D artist with a set of correctly-scaled models.

If XCAD 2000 seems deep. XCAD 3000 is an abyss. But personally I'll take a season in the abyss anytime. XCAD 3000 and Imagine is a potent combination.

In case you haven't seen what a combination of XCAD 3000 and Imagine can do, here's a clue...

CHECKOUT XCAD 3000

Features

XCAD 2000.

000000000 A comprehensive set of 3D modelling commands. Not quite as punchy as

Documentation

0000000000 Heaps, but only a couple of examples.

Ease of Use

00000000000 Takes even longer to get comfortable with than XCAD 2000.

Value for Money 0000000000

A snip compared to similar programs on other computers.

Overall rating 000000000 Quite awesome on a powerful Amiga.

CHECKOUT XCAD 2000

Features

Reasonable, considering the absence of decent CAD packages on the Amiga.

Documentation

All there, in 450 pages, it starts simple, then throws you in the deep end.

Ease of Use

Maybe I'm being generous. You'll either love it or hate it.

Performance

Zooms and redraws like lightning.

Value for Money

At this price, it's very good value for money.

Overall rating

Sacrifices some power in exchange for being user-friendly by CAD standards.

The PC chore...

If you want to run PC software on your Amiga but don't want to fork out for a hardware emulator, then a software alternative may be ideal. Wilf Rees boots up PC Task and runs a PC and Amiga at once...

ad but true: the commercial world is dominated by the PC, and there may be times when you want to bring work home with you but not lug a PC home as well. Or perhaps you need to to run PC software to do something that there isn't an Amiga equivalent for. There are hardware PC emulators you can add on to your Amiga, but these can be pretty pricey and their speed depends on the chip fitted in the emulator. Software emulators are a much cheaper option, and they take advantage of any accelerators fitted In your Amiga - so the faster your Amiga, the faster your on-board "PC", though software emulators in practice are still slower than real PCs in almost every respect.

PC-Task, distributed by Meridian, is a software emulator with the added advantage that your Amiga can both pretend to be a PC and simultaneously remain an Amiga – it multitasks perfectly, operating simply as another application screen. It needs at least 1Mb of RAM to run, but it supports two floppy drives as well as two hard disks, so the environment is pretty versatile. You can create files on any of your hard disks which act as pseudo drives, or use partitions in the normal way.

However, PC-Task does not come supplied with MS-DOS, so you'll have to buy this separately – version 5.0 or 3.3 is recommended.

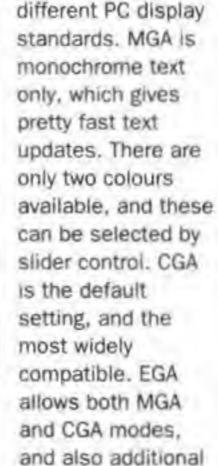

Open up the disk window and you are presented with a collection of assorted icons. Three of these are self-explanatory, offering bootable options for the 68000, 68010, or 68020 and up - you choose the option corresponding to the chip in your own Amiga. An additional icon named TDPatch1213 is provided for people running Workbench 1.2 or 1.3. This routine fixes bugs and adds some features to the trackdisk.device to allow reading from floppy disks and writing to them when the emulator is

running.

Once the **be the right w** appropriate icon is activated, an option screen appears, on which you select system configurations. You can then create a configuration file storing your own settings and automatically loading to these preferences.

Assignment gadgets enable you to define your floppy drives as PC devices A: and B:. These by default are df0: and df1:, but they can be reassigned to any additional external devices if desired. Your assigned drives automatically configure as MS-DOS 720K, or 1.44Mb if you have one of the new-generation Amiga drives in the A4000 series. You can also define the Amiga's parallel and serial ports as LPT1 and COM1 respectively – the PC device names.

PC-Task will emulate four

higher graphic

modes, to run. The

The feature that makes PC-Task really useful – no problem with multitasking whatsoever. This is the PC program Autodesk Animator running under emulation with the Workbench screen behind. "Running" may not be the right word though: it is really really slow!

older ECS chipset will only have the option of four.

To get optimum performance when you wish to multitask, two options are provided to control processor allocation. "Priority when Selected" gives priority to the emulator when it is active and "Priority when not Selected" gives it priority when running as a background task.

only cost is speed. VGA will do all the

other modes. If you have an A1200

additional graphics modes. VGA has

256,000, but sadly Amigas with the

better palette definition, with the

ability to pick 256 colours from

or A4000 with the AGA chipset,

naturally you have access to

The final option on the startup screen is one for memory allocation. This enables you to assign determined amounts of memory to the emulator, up to 704K. Setting the level too low will cause PC-Task to slow down, then fall over.

If you need help, the documentation is particularly good and very comprehensive. There is a very logical sequence of explanations for all of the functions of the software, a glossary and fault-finder to guide the novice, and lots of DOS routines to help with configuration and installation, as well as a list of the principal MS-DOS commands.

Advanced users can choose the option of adding additional commands not available on the startup screen. These need to be accessed via the Shell, and allow several options.

The simplest command enables you to bypass the options screen once all preferences are assigned. A further command offers sympathy to those with old ECS chipset machines with Chip (graphics) memory only: it limits the maximum screen depth which PC-Task will open.
Unfortunately this is a trade-off: limiting the depth will speed up the program, but the price is a reduction in number of colours available.

If your Amiga has internal hardware offering additional serial or parallel ports, you can assign the default operations to secondary ports rather than occupying the main outlets. Default fonts can be assigned, as well as instructions to direct *PC-Task* to get PC memory from Fast RAM. This is only of use, of course, if you have more Chip memory than Fast RAM.

Anyone with a A2000 still fitted with a 5.25-inch disk drive might want to assign this as a drive, and I found it worked okay. Alternatively, if you have an external 5.25-inch drive which is switchable between 40 and 80 track, this will work too, but only if you add a command to your Devs:mountlist file. A final provision allows for CD-ROM support, or so the manual claimed, but try as might, there was no way I could persuade mine to read PC CD-ROMs. I suppose, in all fairness, the manual did say it was a pretty basic driver, but for me too basic.

DIRECT INJECTIONS

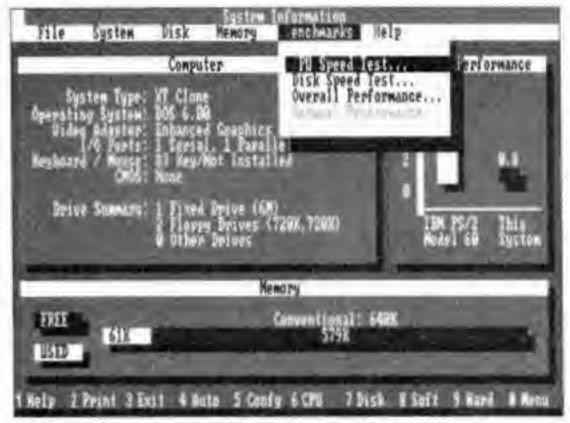

Two further useful options are the ability to prevent the mouse pointer from turning off, and a routine which prevents checks for valid boot codes, just booting directly from any MS-DOS floppy.

An invaluable addition to the program is a mouse driver. You turn this on just before loading a PC program by pressing <left Amiga>-P, and the effect is that the original Amiga mouse pointer replaces the rather boring block cursor synonymous with PCs. An even better solution than this however is to use the utility PCTMouse, supplied with PC-Task. This should be installed in the AUTOEXEC.BAT file on the virtual disk you create. An AUTOEXEC.BAT

You can set a range of configurations from here: floppy disk and hard disk assigns, user port allocations, graphics display, memory allocations and processor options. Lots more preferences are available, but these need to be entered directly via the Shell.

36 AM

Curious to see the real performance of PC-Task? Central Point's PC Tools system info compares the performance of PC-Task against an IBM PS/2 model 60 - a basic 286 machine, not particularly renowned for its speed. The PC-Task performance was .8 compared to 4.6 for the PS/2 - six times slower. No points to score, but my 486DX2-66 comes in at 87.9.

file is the PC equivalent of your Amiga startup-sequence.

ACTION SPEAKS LOUDER THAN WORDS

Once you're past all the set-up procedure, the crucial question is how good is it? The answer is more complicated than a simple good or bad. PC-Task is a pretty remarkable bit of software, but you can't expect miracles from emulation software. In the first place, it is a difficult job cajoling the Motorola 68000 family of processors used in Amigas to perform tasks designed for completely different processors - the Intel 8088 or 8086 in early PCs, the NEC V20 or V30 in later machines, or the more recent 386, 486, and the newest generation of Pentium processors. Any program that makes a lot of hardware calls is going to be

hard to fool, and even in the best case there is an unavoidable speed penalty.

It really boils down to what application you want to use. If you want to use your PC word-processor from work, PC-Task should give acceptable performance that will enable you to work at home. If you think you are going to run Windows and exotic PC applications, forget it. The lack of speed is just too

unbearable. This new version of PC-Task is an improvement on earlier releases and is slightly faster, but nothing like enough to run graphicbased programs. I got Autodesk Animator to run, but the screen refresh was so slow as to make the program unusable. Similarly, if you want to run PC games, you'll find that often these are written in nonstandard modes, and PC-Task struggles to support them.

That said, however, this is by miles the best software PC emulator available for the Amiga. If you are patient and laid-back, you will both get along fine. If you want to utilise the facilities offered by top-end PC programs, then sorry, folks, but a hardware solution is the only answer. Even the modest price of PC-Task could help you on the way to buying a second-hand Commodore A2286 card, an altogether faster and more

000000000 SHOPPING LIST PC-Task £49.95

From: Meridian Software Distribution, East House, East Road Industrial Estate, East Road, London SW19 1AR. **= 081 543 3500**

efficient beast, or maybe a Golden Gate 386 or even 486 card, but then you would need a A2000 or higher to fit them. Other hardware emulators are available such as the AT-Once or the KCS, suitable for A500s or A600s. The choice is yours. (A5)

CHECKOUT PC-TASK

Features

One of the program's strengths: it multitasks, and offers loads of configuration options.

Documentation

Excellent, with loads of useful tips on MS-DOS.

Ease of Use

Dead easy to use - after all. PCs are designed for morons - but so slow!

Value for Money

Got to be one of its best points.

Overall rating

The best of the software solutions to PC emulation.

erhaps the most exciting branch of computer graphics is ray-tracing - to render a "3D" picture, your Amiga treats objects as geometrical solids with defined surface textures, lit by specified light-sources, and then calculates how the light rays from those sources would define those objects. You can get stunning results, complete with lifelike shadows and reflections. Whichever

CHECKOUT ACCUTRANS 3D

Features

The software allows extensive control

over the output of the final model file.

Documentation

The manual covers all the necessary information, but is a little difficult to read. The Amigaguide.library helps a great deal for interactive tuition.

Ease of Use

Apart from the large array of buttons, overall the process is fairly simple.

Value for Money

Worth buying if you're into rendering.

Overall rating

Until 3D rendering programs can agree on a standard, this will be invaluable.

3D modeller or ray-tracer you choose, rendering an image is very time-consuming, but that is not the main problem. Various programs differ in their support for the range of Amiga hardware options - display boards such as DCTV, Harlequin, Firecracker, and so on, for example - so you may find that for different stages of the process you'd prefer to use different packages. It may be that rendering your 3D model could be better done on one program and the initial modelling on another. Or you might like to adapt an object created with one package and use it in another. The catch is that the programs available use different file formats. Enter AccuTrans 3D.

AccuTrans 3D enables translations between various 3D modeller/ray-tracer programs' file formats. These include Imagine, Lightwave 3D, VideoScape, Modeller 3D and Sculpt 3D/4D, with Aladdin 4D and Caligari 24 soon to be supported. AccuTrans also supports DXF (Drawing eXchange Format) files, which are considered a standard format for vector-based drawings.

cculrans

DXF support will enable you to import | convert a wooden object into a glass your files into various programs, such as XCAD 3000, AutoDesk 3D Studio, and AutoCAD. DXF support is very useful, because if you are lucky enough to have access to a PC running AutoDesk 3D Studio, then you will appreciate the vastly improved rendering times, even on a basic 386 equipped with maths coprocessor. AccuTrans 3D will work on any Amiga with Workbench 2.04 or higher and 2Mb or more of memory. Although an accelerator is recommended, it is not necessary. A hard disk is useful, because 3D files

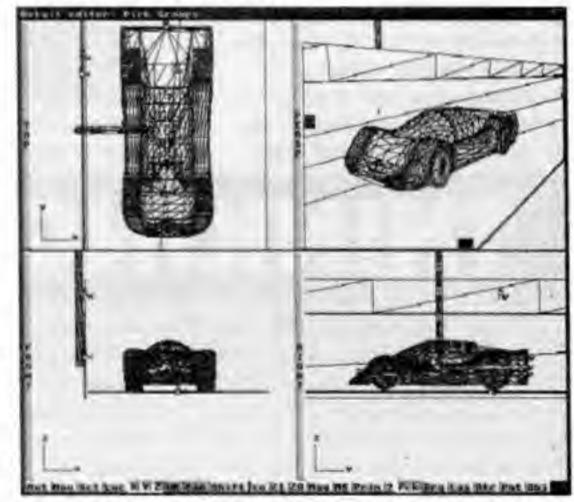

consume heaps of disk space.

As well as converting between various 3D file formats, AccuTrans 3D also enables you to modify various aspects of the 3D models being translated, such as the index of refraction for various transparent materials, or the colours of individual objects. The settings for conversions can be altered to your preference - so, for example, you could

object. A useful list of transparent materials and their equivalent refractive indices is included. With this, you can specify that an object is made out of diamond or ruby.

All of the conversion tests between the supported programs seemed to work, with a high degree of reliability. The only problem I encountered was the omission of some faces while converting Imagine files to DXF files. Apart from this minor problem, all seemed fine. A very handy utility indeed.

Wilf Rees

This model was saved as a DXF file from AutoDesk 3D Studio, converted to an Imagine file using AccuTrans 3D, then loaded into Imagine's Detail editor.

Scan the silver disks

Want to add a CD-ROM to your Amiga? Pat McDonald looks at the **ASIM Compact Disc Filing System.**

t's five AM, I've just spent the entire night looking through literally gigabytes of data on CD-ROMs and CDTV titles, and it could hardly have been simpler.

The ASIM Compact Disc Filing System (CDFS) is a rather neat collection of drivers and utilities to enable you to hook up a SCSI CD-ROM drive to your Amiga, provided it's equipped with Workbench 2.x and a SCSI hard drive interface. Also, purposes it's too small scale.

Other people may consider ASIM CDFS's ability to read CD-ROMs much more useful. Not only can it read the standard ISO 9660 CD-ROM standard used by Amigas and IBM PCs, it can also read Apple's High Sierra format. So if you have the relevant machine or an emulator, then you could (in theory) use foreign CD-ROMs. In practice, you would probably have to spool the data off

It's a real shame that AsimTunes, the music CD management utility, can't read track, album and artist's names off a CD. At least any of the ones I tried.

CDTV and CD32 owners can use one to a hard drive and access the of the utilities, AsimPhoto, to read Kodak-CD picture files and turn them into 24-bit IFF picture files. Wow!

However, you need a few megabytes of RAM to produce a PAL interlaced 24-bit image (768 x 512). Plus, the resulting image probably won't fit on a standard floppy disk. Don't get me wrong. I think this is the most useful feature. It means that anyone who needs some prints or negatives turned into excellent quality Amiga graphics can do it without spending a fortune on a scanner - your local Kodak film processor can scan the pictures and put the files onto a CD, which this program can then convert. Very useful for if you want to do some high quality DTP on a shoestring budget, although for most video

information from there. Even then full compatibility isn't guaranteed. All ASIM CDFS claims to do is give you access to the data on CD-ROMs. It makes no claims about your ability to

AsimTunes is a bundled utility to make using your music CD collection as painless as possible. Which isn't

do anything with the information.

V Fast Directory Search? V Direct Reads? V Sutastart Waimfunes? Mutastart DistChanger?

Mutaboot from CD-Hum?

Williams Limbs on open? SCEE Beales: Continu multiple LUNE? Vendor: Mac Lunion LUN Next Page Saur Cancul

Getting ASIM CDFS going is largely a matter of telling it what your SCSI driver is called and which SCSI unit the CD drive is operating on.

One inventive application for CDFS would be to use it and an Amiga as the heart of a DJ's console. Fitted with a touch-screen and with a couple of SCSI CD-ROM drives, the whole lot could be wired to a PA and cross-fader without much difficulty.

What's the advantage? Well,

using AsimTunes, all you have to do is select the track, hit Play and Pause. You don't have to remember the track name or peer at the album cover, because AsimTunes recognizes and displays this information anyway (or at least it does after you have typed it in the first time).

Cost would be competitive compared to a dedicated DJ rig, and although it wouldn't play vinyl records, you could mix the Amiga's sound output as well and throw in your own jingles and scratches. Good idea, innit? Thanks to Daren Oliver for that and other help with these reviews.

The wonderful AsimPhoto program, designed to read Kodak-CD picture files and turn them into 24-bit IFF picture files. Shame I didn't have any...

much. Basically, you have to sit down with your collection and feed it one at a time through your CDFSequipped Amiga. The computer reads the number of tracks and the length of each song, and you then have to type in the name of the album, the group and each track's name. You can alter the playing order or skip tracks that you don't like.

Once you have saved the resulting database file, the software will recognize the CD next time it's put in the drive. Click on Play and off it goes. I had the impression that all the relevant information was read automatically off the CD. But no, you have to type it in.

I was hoping that this product would let me convert the digital information from a music CD into an Amiga sound sample, but again I was disappointed. Pity. Such a capability would have knocked spots off a conventional sound sampler.

One good thing is that all of the functions of ASIM CDFS can be linked to an ARexx port. I've got no complaints at all about this part of the manual, although a few examples would have been nice for novices.

You do get one free CD surprise surprise, the Fred Fish collection on CD-ROM. If you have never encountered it before, then you can spend many happy hours transferring the programs to floppy and watching them crash, because a lot of them are horribly out of date compared to the sort of Amiga you need to use ASIM CDFS.

In fact, that's the main problem with CDs. All the information you can currently get on them is available on floppy or printed in a book. If you could get titles like "How to hit AGA and AAA Amiga hardware", something that you couldn't get in a book, I might be tempted. As it is, I can't really get excited about a medium that you can't record on and that has a transfer rate slower than a motorway-mashed hedgehog. (AS)

Features 0000000000

Overall quite a good selection of tools. Documentation

00000000000 Good, but a bit economical with the truth in parts.

Ease of Use 0000000000

Tricky to set up at first but plain sailing after that.

Performance 0000000000 Gives access but absolutely no guarantees.

Value for Money 0000000000

The software's reasonable, but SCSI CD-ROM drives ain't!

Overall rating 0000000 If you need to hack CD-ROMs, this does

the job quite well.

PRODUCT

full use of the LP1200's 400 dpi printing capabilities, such

as using Microsoft Windows forits. Unique additional standard

features include FLASH ROM Witum proof rectinology and LAYOUT -a powerful document asscription language. The LP1200's unique internal

FLASH ROM, which holds the printer controller firmware, can easily be updated as new developments in technology occur. This protects the

investment you make in buying a Ricoh LP1200. Other manufacturers

would require you to buy a new panter! Internal FLASH ROM and

industry standard FLASH ROM PCMCIA cards can also be used to

permanently store fonts, macros, graphics and extra emulations. Again,

unlike the competition, the LP1200 includes LAYOUT, a powerful and

Copy right

wners of X-Copy II, that most popular of backup programs, will welcome this updated and extended version, which boasts new features such as hard disk back-up and file management facilities, as well as a complete rewrite of all your favourite cloners.

There are six separate utilities on the disk, two dedicated to copying disks. The first, X-Copy Professional, does not require the supplied dongle for any of its functions. Four levels of copy are available:

- DOScopy is a straightforward fast copier for AmigaDOS disks.
- DOScopy-Plus is similar but attempts to correct any errors it finds on the source disk as you copy.
- BAMcopy-Plus is a very fast copier, with the capacity to ignore

X-Copy includes four back-up programs. Cyclone is the heavy-duty copier with the most sophisticated, but unfortunately slowest, means of duplicating your data.

any tracks on the source disk which are empty. It also attempts error correction onto the cloned disk.

 Nibble is the slowest, but by far the most accurate, backing up the majority of protected disks, and it even has the brilliant capacity to copy disks from other computers such as Archimedes or Atari ST.

Within each of these four copying modes, there are additional tools for disk or system management:

- Optimise reorganises disk data, enabling files to be loaded faster.
 Only operable with AmigaDOS disks.
 Optimise needs at least 1Mb of RAM. From experience I would advise using this only on back-up disks.
- Format and QFormat are both speedy formatting utilities, working in about 40 seconds. QFormat additionally removes the directory and name of the disk.
- Erase will de-format a disk, rendering it suitable for copying onto.
 While the use of new, unformatted disks is always recommended, Erase should not give you any problems.
- Install will write a bootblock onto a disk, and there are five options

Wilf Rees tests X-Copy & Tools, a suite of powerful data back-up and disk management utilities.

within it: you can make the disk bootable or not, FFS bootable or not, and run a virus-detection routine as well as install a boot-block.

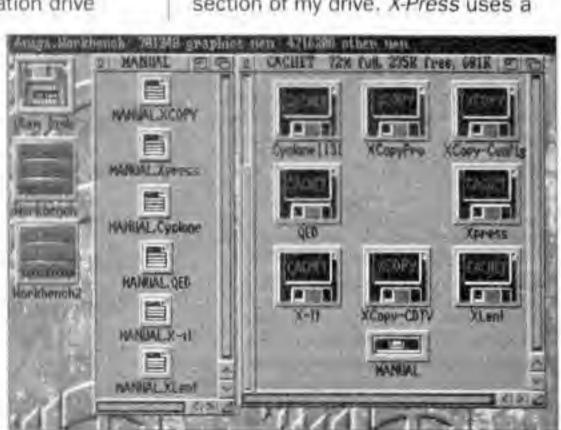

- Speedchk looks at the speed of a disk drive. This is useful for comparing the comparative speeds of the source and destination drives when you want to do some copying – the nearer together these are, the better, and ideally 300 rpm.
- DrivesOn is a routine to make your Amiga think it has four disk drives.
- KillSys is a memory optimiser, useful mainly to those whose Amigas have only 512K of RAM.
 - Directory will
 display the current
 directory of the disk,
 and Checkdisk, one
 of the most useful
 features, will
 analyse the disk for
 errors of various
 kinds, displaying a
 red error number
 which you can look
 up in the manual.
 - Finally, Default resets all of the options to their default settings.

Any of the above options can be

selected using the illuminating gadgets on the control panel. When copying, you can select start and end tracks, and it is possible to integrate different copying modes into one single copy. Using the program is simplicity itself, but one word of caution: always write-protect your source disk. It is all too easy to wipe a disk, either by inserting the disks into the wrong drive or by not setting the source and destination drive indicators correctly.

BIG GUNS

Cyclone is the second copier in this suite of programs, and it is intended for those disks which X-Copy cannot handle. Unlike its junior brother, Cyclone requires the dongle supplied with the package. This is very well made compared to the previous version, which was simply a couple of

The impressive range of programs in the X-Copy & Tools suite, as shown when the window is opened. The manual directory describes its contents.

connectors joined by a few soldered pins. Five modes of copying are offered - three are standard modes. and two are high performance modes named "AWPM" (Adaptive Pulse Width Modulation) modes, which use the drive's pulse to lock the speed of sender and receiver together, the ideal conditions for duplicating. These are slow copiers, but the standard of achievement is excellent. Cyclone also hosts a Speedcheck and a Wipedisk facility. I have not found anything that Cyclone will not copy - it even backed up the sample disks for my Roland S550 sampler, notorious beasts to duplicate. Both X-Copy and Cyclone are first-class pieces of software, and they should

Aside from these, the tools in this suite vary in quality and usefulness. X-Lent is a file-handling tool similar to SID but not as good. All of the usual facilities are there—copy, move, rename, delete, and so on—as well as 14 user-definable custom gadgets. I found X-Lent worked okay but I really wasn't happy with the graphic interface, probably because I am so accustomed to using Directory Opus.

enable you to back-up any data.

X-Press is a hard-disk back-up utility similar to all the usual programs of that ilk (and not to be confused with Quark XPress, the professional DTP package on the Mac and PC). The expected commands are all there, as well as the ability to archive, flag and filter files. I must confess that I avoided backing up my entire hard disk – frankly I am not that trusting – but the cluster of directories I did back up successfully restored to an empty section of my drive. X-Press uses a

"Tree Disk" at the completion of a back-up, to display all of the structure on the disk. This is the most important part of the back-up, because all commands to restore selected or filtered files are done from the key disk.

QED is a text editor, and really one of the stars of this suite. The rather stark appearance on loading belies its very powerful and friendly nature. All commands are called by key commands, using either <Ctrl> plus a key or <Alt> plus Function keys. Text manipulation approaches word processing standard.

QED also comes in handy to read the manual. Some people loathe disk-based manuals, others love them. I am of the latter persuasion. Producing glossy printed manuals is expensive and time-consuming – this way keeps the price down. The manuals for X-Copy & Tools are excellent – every conceivable aspect of each program is covered, and since you can select to print out only those aspects of the manual you want, you don't end up with useless reams of paper littering the room.

Considering the power and usefulness of this package, it is a must for anyone who needs to back up important data, and it offers a good range of data management utilities into the bargain.

CHECKOUT X-CopyPro & Tools

Features

An amazing collection of programs to handle a multitude of back-up and management tasks.

Documentation

Very comprehensive, though some people may not like the fact that it is disk-based, with only a few notes.

Ease of Use

A doddle really.

Value for Money

Incredibly cheap for guarding all of your precious data against accidental damage.

Overall rating

A must.

rom IL-Soft comes version 3 of their embroidery/sample designer, incorporating many of the characteristics usually found in art packages, with new added features.

The worksheet environment is essentially a piece of graph paper, with a collection of assorted icons underneath enabling the user to manipulate many possible features.

CHECKOUT X-STITCH DESIGNER

Features

All you need for the task, even an invaluable IFF conversion facility.

Ease of use

A doddle for any age from 6 upwards.

Documentation

Simple but clearly written.

Value for Money

limited market.

Not too pricey, but caters for only a

Overall rating

Does exactly what it says and does it pretty well.

The worksheet is larger than the Amiga screen, so a white square with an inset gadget gives an indication of which area of the design you are currently working in. You use the mouse for virtually all input of design, and you control the editing and disk activity from the keyboard. A colour choice panel displays 16 different selectable stitch colours, all of which can be adjusted using the familiar style of RGB slider bar to match particular yarns or cottons. You can also select stitch type using an icon-driven menu offering the most frequently-used stitches.

The package is really easy to use. The manual is only nine pages long, but explains in very easy to understand English how to use the software. Loading any of the five samples from disk (you just hit "L" for Load) and exploring ways of changing them is probably the easiest way to become familiar with the package. You can choose, for

000000000 SHOPPING LIST

X-Stitch Designer£34.99 From: IL-Soft, Buttercross House, 16 Langdale Gate, Witney, Oxfordshire OX8 6EY **☎** 0993 779274

X-Stitch Designer

example, a back-stitch type as any form of vertical, diagonal, horizontal or cross-stitch pattern, though this is only available in one colour.

Once you have created a basic pattern, you can exploit the powerful editing facilities. First it is possible to cut sections from other patterns and incorporate them into a current design: you call up the desired source file, draw a mouse-controlled box around the section to be captured, then use a simple find and

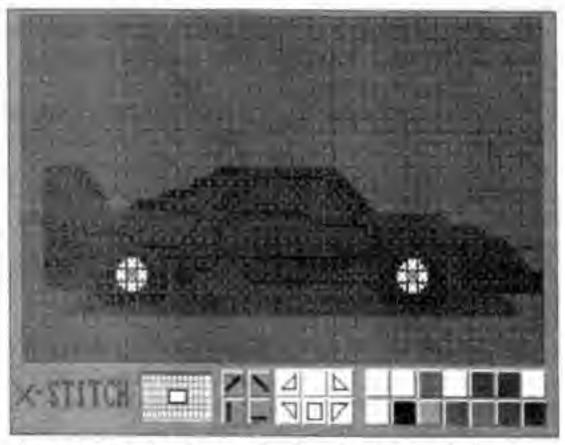

paste procedure to place the section into your existing design. You can also rearrange a design using "Block" functions to manipulate existing elements. The options available are Fill, Delete, Move, Copy, Turn, Mirror and Enlarge, each executed simply by hitting its first letter.

There is even the facility to import IFF files and convert them to X-Stitch format. Any 16-colour

image can be imported, giving you a tremendous opportunity to take advantage of all manner of external devices such as digitisers and scanners, making it easy to generate exciting pictures without the need for any great drawing ability.

This is a very well designed and exceptionally easy to use package which deserves a place in any school or home where textile work has a high priority.

Wilf Rees

An example of a Ferrari (that's what it says!), in the samples directory. Not the best of the offerings, but a really friendly interface and very easy-to-use control system make X-Stitch Designer a smart package.

Ithough the A1200 is without doubt the best value full 32-bitarchitecture computer on the market, its expandability is severely hampered by the fact that it has only one 150-pin 32-bit slot. This means you have to choose your upgrades carefully. But you'll rapidly

CHECKOUT TURBOTECH A41200

Features

Battery-backed-up clock, 32-bit, 70 nanosecond ZIPs - impressive.

Fitting

No problems - a tight squeeze, but easy to manage.

Documentation

Minimal but adequate.

Value for Money

Compares very favourably with 16-bit 4Mb expansions.

Overall rating

Cheap, cheerful, and may just fill your requirements.

outgrow the A1200's standard 2Mb of Chip RAM, so a memory expansion like this is a good option.

The Turbotech A41200 board boasts 4Mb of 32-bit "zero wait state" RAM and a real-time batterybacked-up clock. It is well-made, but worryingly, on the underside of the board, there is a kludge in the shape of a small string of copper wire. While this shouldn't be a problem once the board has been fitted, fitting is a bit of a squeeze and the slightest bit of mishandling during installation could break it.

As for the claims by Siren that the A41200 can more than double the speed of code execution over a standard Amiga, we've got to remain sceptical. You certainly wouldn't get that with a typical application. However, there is no doubting that loosing the CPU from the shackles of the co-processors will result in an

000000000 SHOPPING LIST Turbotech A41200 memory expansion£169.99

From: Siren Software, Wilton House, Bury Road, Radcliffe, Manchester M26 9UR

TO 061 724 7572

overall speed increase. We checked exactly how much, using Amiga Intuition-Based Benchmarks v5.0.

Assuming a figure of 1 in each of the following categories for a standard A1200, these are the figures with the expansion.

Integer: 1.19

· Graphics: 1.16

. Floating Point: 1.33

As can be seen from the results, the A41200 certainly increases the overall efficiency of program execution. However, it definitely does not double the speed. The average

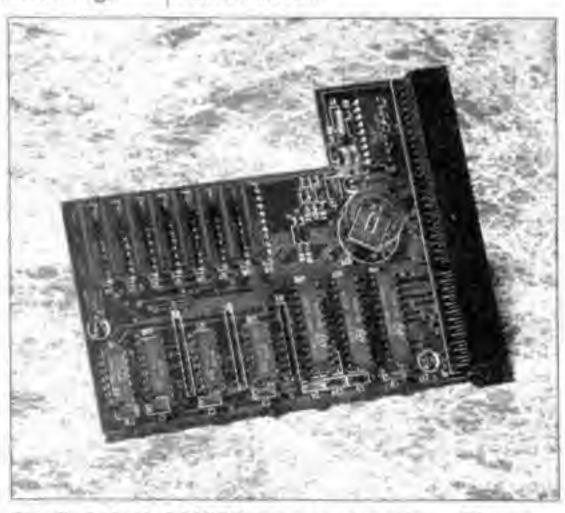

figure we derived from the above table somewhat coincidentally tallied with the the Installation Manual and User Guide's speed increase statement of 122%.

The A41200 is a commendable piece of hardware. When you consider the special introductory price of £169.99 (only £10 more than a typical 16-bit 4Mb memory expansion), it's a steal. Expanded A1200s

leave you a relatively unconstrained hand to explore the sizzle the machine offers - multitasking, video applications, desktop publishing, raytracing, the lot.

The downside of the board is the fact that it is closed-ended. You can't add any more memory to it. Neither can you add an FPU, an accelerator or a SCSI interface. If all you need is 4Mb and a battery-backed clock, we have no qualms about recommending the unit. If not, you'll have to consider looking elsewhere.

THE AMIGA SHOPPER SUB

YOU KNOW IT MAKES SERIOUS SENSE...

EIGHT GOOD REASONS WHY YOU SHOULD SUBSCRIBE TO AMIGA SHOPPER

- You make sure of your copy each and every month – guaranteed!
- Your copy is delivered direct to your door no more queuing at the newsagent's.
- You receive an exclusive subscribers' newsletter every month into the bargain, full of fascinating behind-the-scenes information, at no extra cost.
- 4. You are guaranteed no price increases for a full 12 months, even if the price goes up or VAT is imposed on periodicals.
- You pay no more for any higher-priced issues with special cover-mounted promotions.
- If you use the handy direct debit form, you save a whopping £5 off the news-stand price.
- With direct debit, there are no more forms to fill in when your subscription runs out – we do all the work for you.
- And of course, you'll receive a speciallydesigned Amiga Shopper binder, worth £4.95, absolutely free.

AMOS Action

Jason Holborn extends our AMOS paint program with the addition of a selection of extra painting tools.

s you will know if you've been following Amiga Shopper over the last few months, we're hard

at work on a paint program written completely in AMOS. DPaint it may not be, but already ASPaint is starting to show its true colours (ouch). Already we have added a toolbox strip, a colour selector and a couple of painting tools and this month we continue by adding a couple of extra painting tools - all done within AMOS.

This month also sees the release of a couple of new AMOS products. First up is Craft, a brand new extension that adds over 160 new commands to both AMOS and AMOS Professional. Craft offers ready-to-go fractal generation commands, a couple of very handy new selectors (including a very good colour selector), improved sound and music commands, powerful directory scaning commands and a whole lot more besides. Craft costs £24.95 and is available from Black Legend on 0727 868005. Watch for an indepth review in Amiga Shopper soon!

Another monumental piece of news is that Future Publishing (the company that bring you Amiga Shopper every month) have just published a comprehensive book on AMOS games programming entitled Ultimate AMOS. The book, which just happens to be written by me, covers virtually every aspect of programming AMOS's "special" features such as screens, bobs, rainbow, scrolling, AMAL and so much more besides. Unlike other AMOS books, however, Ultimate AMOS shows you how to apply all this knowledge to games programming. Included with the book is a disk that includes all the source

code from the book and four fullycommented AMOS games. What's more, all this can be yours for just £19.95! See the advert on page 124 for the full ordering details.

Anyway, that's enough of the blatant book pushing. Let's get stuck into this month's juicy segment of code. It's on pages 102-103, but to save you typing it all in, once again you'll find it all on the cover disk.

1/2. Before we can add the new procedures to ASPaint, we need to add a few extra lines to the

PROCESSTOOLS procedure so that the program recognises them when the user presses the appropriate gadgets. Note that the first two If...Then constructs have already been entered, so ignore these.

2. The first If ... Then construct that we enter passes control to the

LINEDRAW function if the user clicks on tool gadget number 2 in the toolbox window. This is indicated by a value of 2 being held in the SELECTED variable.

If the SELECTED variable contains a value of 3, the program jumps to a procedure called

OUTLINEBOXDRAW that, logically, handles the drawing of outline boxes.

4. If the SELECTED variable contains a value of 4, the program jumps to a procedure called called

FILLEDBOXDRAW that, not surprisingly, handles the drawing of filled boxes.

If the SELECTED variable contains a value of 5, the program jumps to a procedure called called

OUTLINECIRCLEDRAW that - you

guessed it handles the drawing of outline circles.

procedure finished for this month. Note that as we add new painting functions, this procedure must be updated accordingly, or ASPaint will not recognise our new painting tools.

8. The first of our

new painting tools is the line draw function that handles the drawing of straight lines.

9. The procedure is called every time the program's main loop is performed, but the

main core of the procedure is not executed unless the user is pressing the left mouse button and the mouse pointer is over the painting screen. If both of these conditions are true, then the user is marking the start of the line that they wish to draw.

10. As with all our previous painting tools, the first thing we must do is to update the "Undo" buffer so that if our users make a mistake, they can remove the line they have drawn.

11. Our paint program enables the user to reposition the line using a technique called "rubber banding", which constantly redraws the line without corrupting the background screen until the user decides that they're happy with the position of the line. This is done using AMOS's

"Reverse" drawing mode. (Amiga OS programmers will know this better as JAM mode 3.) We therefore start the procedure by changing the drawing mode using the "Gr Writing" command.

12. The next thing we do is to get the 'X' and 'Y' screen coordinates of the start of the line by reading the coordinates of the mouse pointer.

The procedure then enters a "Repeat...Until" loop that constantly reads the position of the end of the line and draws a preview of the line.

14. We already have the start of the line, so we now need to read a second set of coordinates that will be used as its end coordinates.

15. Using this second set of coordinates, the line is drawn on to the screen. Note that at this point, the line is not drawn in its correct colour - because we're drawing in JAM mode 3, the pixels that lie beneath the line are simply reversed. The program then waits for a vertical blank (so that the user can actually see the line) and then removes it by drawing a reversed line using exactly

With all this month's code added to ASPaint, you should be able to draw lines, boxes and circles. And you don't even need to type all the code in yourself you'll find it all on this issue's cover disk!

the same coordinates. Drawing a reversed line on top of the reversed line we have already drawn restores the display to its original state.

16. If the user lets go of the mouse pointer, the two sets of coordinates that we have are taken to be correct. so the procedure moves on to actually draw the line into the display. In order for the line to be drawn correctly, the drawing mode is changed to JAMO.

17. Just like DPaint, our paint program enables the user to use a variety of different brush sizes and styles. The first thing that the procedure therefore does before drawing the line into the display is to check the type of brush being used.

18. If the user is using a simple onepixel brush (the default setting), the line is drawn directly into the display using the AMOS Draw function.

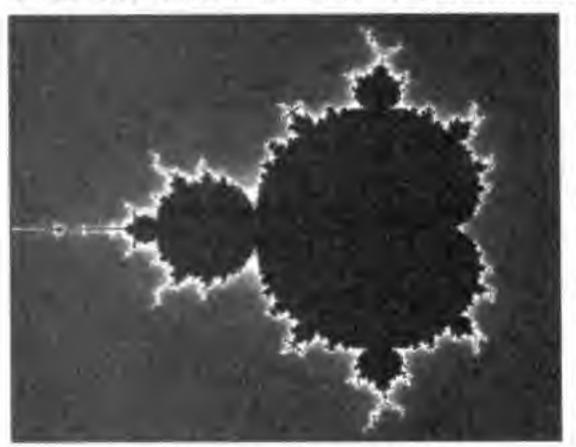

19. If, on the other hand, the BRUSHSIZE variable contains a value greater than zero, a procedure called DRAWBRUSHLINE is called. This new procedure draws a line using the currently-selected brush. We'll cover this procedure later.

20. Well, that's the line draw function complete. Now we move on to the _OUTLINEBOXDRAW procedure.

21. Once again, the first thing we do is update the "Undo" buffer so that the result of this drawing function can be removed if the user wishes.

22. Once again, ASPaint's outline box tool uses AMOS's "JAM3" drawing mode to allow you to expand and shrink the size of the box in real time until you get the exact size that you want. The procedure therefore switches to JAM3 mode using the "Gr Writing" command.

23. Before we can start drawing the

The new Craft AMOS extension provides 160 new commands, including support for fractal generation.

box on to the screen, the current position of the mouse pointer is read and converted to screen coordinates. These coordinates will be used as the "origin" point of the box and the box will be anchored at this point.

24. With the origin of the box now fixed, the first set of coordinates is read into the variables 'X1' and 'Y1'.

25. The technique used to draw the box is very similar to the technique we used to draw the preview of the line in the _LINEDRAW function. The

function, the box drawing tool can take advantage of brushes of different sizes and shapes. Once again, the box is drawn onto the screen using two different techniques, depending upon the current brush setting.

28. If the brushsize is set to zero (indicating a single-pixel brush), the box is drawn onto the screen using AMOS's own "Box" command.

29. If the user has selected a brush that is larger than just a single pixel.

> has to be drawn in four stages using the same DRAWBRUSHLINE function that we used in the line draw function. Each edge of the box is drawn separately as a straight line, and these eventually join

however, the box

30. With the outline box draw tool complete, we move

up to form a perfect

square.

on to the filled box tool. This is essentially the same routine but is more complicated, because AMOS's "Bar" command (the command that draws filled boxes) is rather picky about its parameters.

31. After checking both that the left mouse button is depressed and that the mouse pointer lies over the

drawing screen, the "Undo" buffer is updated.

32. Once again, we'll allow the user to "rubber band" the box in real time so that they can stretch and compress it at will. The program therefore starts by switching AMOS's drawing mode to JAM3.

33. The origin of the box is then read from the mouse pointer and stored into the two variables 'X2' and 'Y2'. These are automatically converted to the screen coordinates system using the "X Screen" and "Y Screen" functions.

34. The routine then enters a "Repeat...Until" loop that is performed until the user lets go of the left mouse button.

35. AMOS's "Bar" command is very fussy indeed about the format of the parameters that are passed to it. The first two coordinates must be smaller than the second set. If not, your AMOS program will crash. Our filled box routine gets around this problem by constantly monitoring the two sets of coordinates to make sure that the "Bar" command is passed legal values. The first of these checks is made to see whether we've already swapped the 'X' coordinates. This is indicated by the variable 'XT' being set to 1. If the 'X' coordinates have been swapped, they are swapped back so that we don't lose the origin coordinates when a new set of coordinates is read from the mouse pointer.

36. The second check is performed to see whether we've already swapped the 'Y' coordinates (indicated by 'YT' being set to 1). If they have been swapped, they are swapped back.

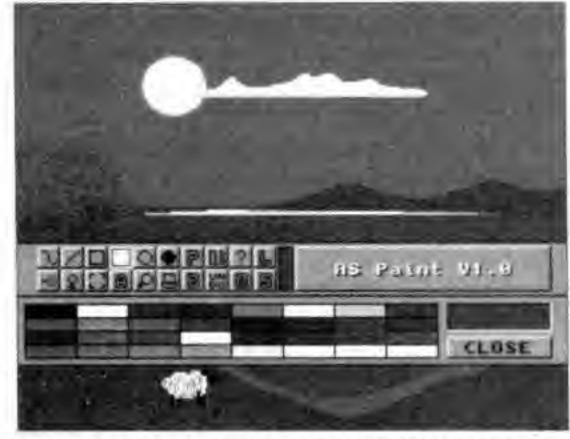

37. With the coordinates restored, a new set of coordinates is read from the mouse pointer and placed into the variables 'X1' and 'Y1'.

38. At the moment, the coordinates are in their original form, so the two flags 'XT' and 'YT' are reset to zero.

39. The variable 'X1' is used as the left-hand coordinate of the box, which means it must be less than 'X2' if the "Bar" command is to accept it. We therefore check to make sure that this is true. If it isn't, the two variables are swapped and 'XT' is set to 1 (indicating that they have been swapped).

40. Just like the 'X' variables, the 'Y1' variable must also be less than the 'Y2' variable. If it isn't, 'Y1' and 'Y2' are swapped and the variable 'YT' is set to 1 so that AMOS knows we've swapped them.

41. The "Bar" command also insists that all four coordinates must be different - if 'X2' and 'Y2' were the same, for example, your program would crash. The program therefore check to make sure that all four values are unique before drawing the filled box onto the screen, waiting for a vertical blank and then removing it. This section of code handles

Let your artistic talents run wild with ASPaint. As they say on Blue Peter - here's one I prepared earlier!

box is drawn on to the screen and the program is halted until the next vertical blanking period before the box is removed.

26. Now that we know the exact coordinates of the box, the drawing mode is reset back to JAMO.

displaying the "preview" of the box.

- 42. The loop is then terminated if the user lets go of the left mouse button. The two sets of coordinates are then taken to be correct.
- 43. After swapping back to JAMO (graphic replace mode) and checking to make sure that the two sets of coordinates are different, the box is drawn onto the screen.
- 44. Phew! That's another tool complete. Now we move on to the OUTLINECIRCLE procedure that is responsible for drawing outlined circles. This too is fairly similar to the other functions, except this time we make use of AMOS's powerful blitter-based "Ellipse" command.
- 45. Once again, after checking that the user is actually trying to draw onto the screen and updating the "Undo" buffer accordingly, we set the graphics drawing mode to JAM3.
- 46. The centre point of the circle is then read from the mouse pointer and placed into the variables 'X1' and 'Y1'.
- 47. The routine then enters a "Repeat...Until" loop that is performed until the left mouse button is released. The first thing that this loop does is to read the radius of the circle from the mouse pointer.
- 48. AMOS's "Ellipse" command is just as picky about the format of its parameters as the "Bar" command.

so we need to start by making sure that the two sets of coordinates that we pass are not the same. If 'X1' and 'X2' were to be the same, for example, the 'X' radius value would be an illegal value of zero.

- 49. Obviously the radius of a circle is a value relative to the centre point of the circle, so we need to convert the "absolute" values returned by the "X Mouse" and "Y Mouse" functions into valid 'X' and 'Y' radius values, We start by checking to see whether the value in 'X1' is greater than the circle's 'X' centre point, If it is, 'X1' is modified by subtracting the value of 'X2' from it. If 'X2' is greater than 'X1', however, the value of 'X1' is subtracted from 'X2' and placed into 'X1'. This gives us a legal 'X' radius value.
- 50. The same procedure is then carried out for the 'Y' radius value so that the value held in 'Y1' is a valid radius value.
- 51. The "preview" of the circle is then drawn, and removed after a vertical blanking period using the "Ellipse" command.
- 52. To enable our paint program to draw circles using the brush styles that we defined last month, we need to check to see whether the user has selected either a single-pixel brush ("BRUSHSIZE = 0" or any other brush ("BRUSHSIZE > 0").
- 53. If the user has selected just a single-pixel brush, the circle is drawn

onto the screen using the "Ellipse" command.

- 54. If the user has selected any other brush style, we can no longer use the "Ellipse" function to draw our circle. We therefore have to draw it ourselves using the math functions Sine and Cosine. This takes some time, so we need to let the user know that AMOS is drawing a circle by turning the mouse pointer into a "sleepy" pointer.
- 55. By default, the Sine and Cosine functions use radians, which aren't really suitable for our needs. We therefore switch to more usable degrees using the command of the same name.
- 56. Each point in the circle must be calculated separately and therefore we use a loop that counts from 0 to 360, which plots a point for each of the 360 degrees in a circle.
- 57. The 'X' and 'Y' coordinates of our circle are then calculated using the "Sin()" and "Cos()" functions.
- 58. The results from these two calculations are then used as the coordinates of a point within the circumferance of our circle which is drawn onto the screen by passing the two values to the

DRAWBRUSHPOINT function that we covered last month.

59. The DRAWBRUSHLINE procedure is a slightly modified version of the _DRAWBRUSHPOINT

procedure. It simply draws a line in the currently-selected brush style between two coordinates.

- 60. The brush pattern definitions are held in a two dimension array containing eight different values for each brush. These values are extracted by using a loop that counts from zero to 7.
- 61. Each of the eight values assigned to each brush definition is transferred into a string variable called "BITMAP\$" in binary notation. In many ways, this technique is the same as the technique we used to draw the toolbox gadgets. A zero in the binary pattern turns the pen off and a value of 1 turns it on.
- 62. Each bit in the binary pattern is extracted in turn by entering a second loop that counts from 1 to 9.
- 63. By default, each and every brush will be drawn on the screen using the 'X1' and 'Y1' coordinates as the origin at the top left-hand corner of the brush. In order to centralise the brush so that it is drawn immediately below the mouse pointer, a set of offsets is calculated.
- 64. Finally, a quick "If...Then" decision is made to check whether a point should be plotted. Using the counter that is updated by the second loop, each bit in the binary number is checked to see whether it is a 1 or a zero. If it is a 1, a dot is plotted onto the screen using the AMOS "Plot" command. (AS)

"PERUSED THE PAGES"

I am one of a small but significant group of serious Amiga enthusiasts whose specialist interest is theological study. As I have perused the pages of your excellent magazine, I have found a reference in advertisements to only one particular program relating to my particular interest and that is The King James Bible, a PD package which I have acquired, and which I have found to be of considerable

In contrast, I note that a wide range of programs have been produced on other computer formats to meet the needs of Bible students. To list but a few: the complete Bible in numerous translations, including the New International Version, the New Living Bible, the American Standard

Bible, and the Good News Bible; Bible dictionaries; a Bible handbook; Bible commentaries; various Concordances; Hebrew and greek Dictionaries; a Bible Encyclopaedia; and a Bible Atlas.

It is possible that such programs have already been produced to function on the Amiga range of computers? I am sure that serious Amiga users like myself would welcome any information which could be provided through Amiga Shopper about additional Bible-based computer software.

> John Budge Glasgow Scotland

Being a member of God's loyal opposition, I'm afraid I don't know of any Bible programs. However, there is a group of people who may be able to help: Bible Bureau. Contact Ad at 24 Brodie House, 10 Harcourt Avenue, Wallington, Surrey SM6 8AR □ 081 669 7485.

"ONE SMALL GRIPE"

One small gripe I have is about the way that some of the public domain software is reviewed in Amiga Shopper. 95% of the time I find lan's reviews useful and helpful. When I have the product he is describing, I find I tend to agree with the comments he makes.

However, I'm a developer of Windows (and Intuition!) based packages, and I feel that sometimes he is a little negative when reviewing programming or development tools. The review that finally made me write something was the one of the Touch program, in Amiga Shopper 32. Ian may not consider such tools useful, but I (and I'm sure many programmers too) find this sort of tool vital when it comes to development and project management.

If I "touch", for example, all the source files for a given project at a recognised point in the development, then later I have an obvious and effective method of checking which files have changed since that point.

This is perhaps not the best example, but the use of Touch is not really the point of the gripe. What I'm really trying to say is that in future I'd like to see lan be a bit more constructive when he reviews this kind of software. If he genuinely can't see the point of something, that's fair enough, but then instead of knocking it, could he just mention it under a list of items "Also on the disk..."?

> **Rob Uttley** Charlton London

I asked lan for his reply, and this is what he said: "I'm very surprised to hear you think that, and it's certainly not my intention."

I'd add that I do think it's a reviewer's job to assess the usefulness of a product, lan couldn't see a use in the case of Touch, and you've put him right. Fair enough.

"A BIG STEP BACK"

I notice at the end of your column that invite letters about the software which we'd like to see on the Amiga. I wonder if you would consider the subject of Windows NT? I realise that it's a processor and memory hog, and probably a big step back from AmigaDOS and Workbench. However, given that much, if not most, of its functionality already exists in the Amiga, it would not be a major job for a large company (or really

ambitious PD author) to convert and could with one set make most popular software packages available for the Amiga (when they are rewritten for NT, of course).

What do you think? Just how practical is such an idea?

> **Graham Keellings** Munich Germany

I think writing some sort of Windows NT emulator would actually be a huge job, and then there's the problem of copyright...

In fact, Commodore's next machine (currently code-named the A5000 and scheduled for release late next year) is expected to have support for Windows NT. It will do so by having a processor which is compatible with the operating system - you'll be able to install it on the A5000 as you would on a PC.

In the meantime, we've been asking some of the software big guns (Microsoft and friends) if they are planning to port any of their applications programs over to the Amiga. You can read what they have to say in next month's issue.

"REPAIRED ONCE BEFORE"

Back in May I bought an 85Mb hard drive from Diamond Computers at their Manchester store. Recently it started to behave badly, with checksum errors and so forth. Trying to contact Diamond proved fruitless, and I finally found out they had gone bust.

A friend suggested I contact the drive manufacturer (Western Digital), which I did. The lady I spoke to there told me they would honour the guarantee. Great, I thought, one hard drive repaired by the manufacturer and no more problems. She asked me a for a few details about the drive, including its model number, and then asked if the drive had already been repaired once before. I told her no, that I had bought it brand new, but she insisted that what I had was a reconditioned drive. I was given a repair order number from the manufacturer to send the drive back to the factory in Singapore for the repair to be carried out.

What I want to know is, who else besides me got ripped off by being sold reconditioned drives disguised as new ones?

> Barry Miller Widnes Cheshire

I'm sure this must be an isolated incident. Well, I hope it is, anyway. It just goes to show, you can never be too careful.

Please keep your letters coming the best each month wins £25.

I think your cover disks are a good idea. Would it be possible to include on £25 WINNER one (or more) of them

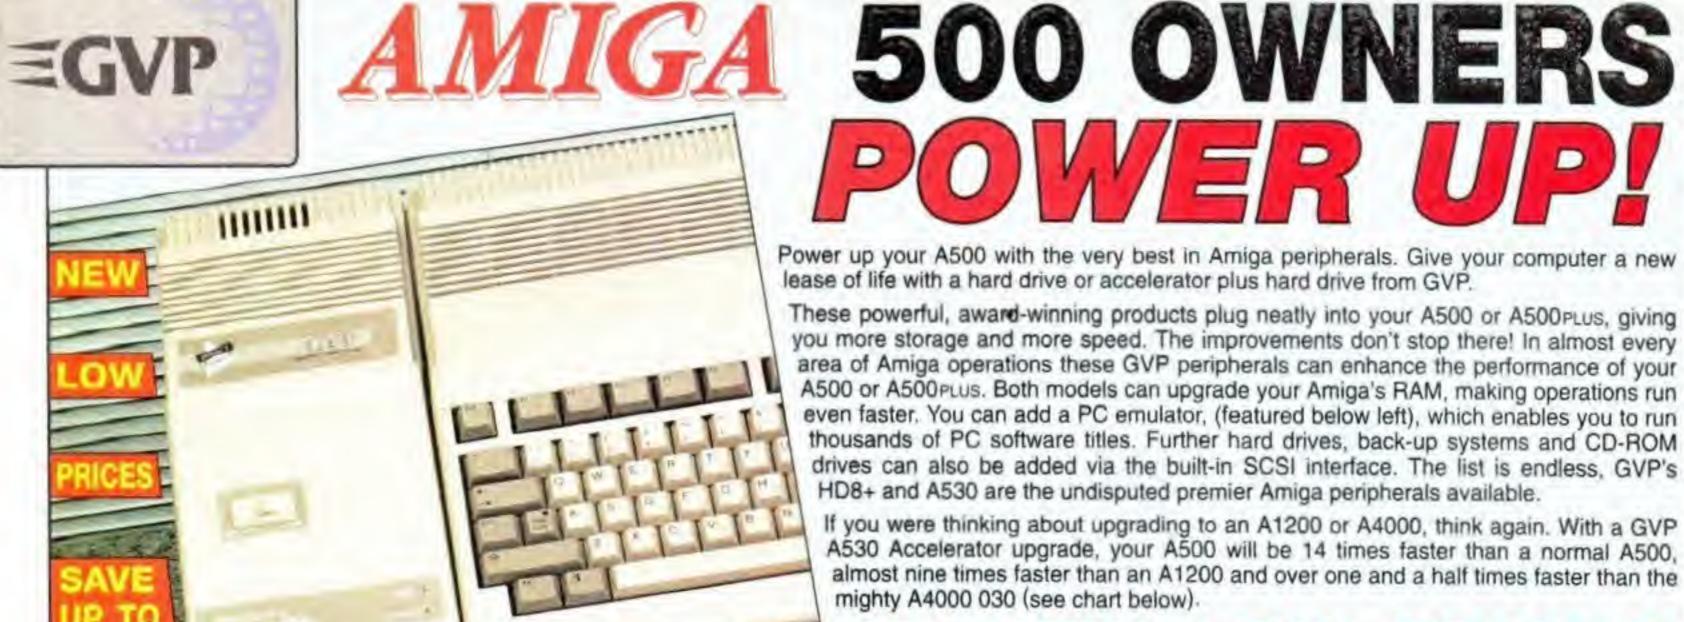

a public domain database with all the articles and so on in all issues, entered and crossreferenced, giving easy access to items which we know are there somewhere, but can't find? It's a daunting task to search by hand through the now sizeable library of Amiga Shoppers!

Also, I know that you try to cover all aspects of computing, but (there's always a "but"!) don't you think too much space is given over to DTP and reams of copy about fonts? In the limited space available, could we have more

articles on using packages painting, digitising, sampling etc.? H J J Weddle Heaton **Newcastle Upon Tyne**

We were, some time ago, planning to release an index in conjunction with a software house, but that fell through. It's still a good idea, and one I hope to implement soon, but the information would be copyright Future Publishing, not PD.

I agree with your other point and intend to shift the emphasis of the magazine more towards the "using" or tutorial side of things. Still, don't you think articles on fonts are useful for people who want to know how to use their word processors and DTP packages?

EGVP

Power up your A500 with the very best in Amiga peripherals. Give your computer a new lease of life with a hard drive or accelerator plus hard drive from GVP.

These powerful, award-winning products plug neatly into your A500 or A500 plus, giving you more storage and more speed. The improvements don't stop there! In almost every area of Amiga operations these GVP peripherals can enhance the performance of your A500 or A500 PLUS. Both models can upgrade your Amiga's RAM, making operations run even faster. You can add a PC emulator, (featured below left), which enables you to run thousands of PC software titles. Further hard drives, back-up systems and CD-ROM drives can also be added via the built-in SCSI interface. The list is endless, GVP's HD8+ and A530 are the undisputed premier Amiga peripherals available.

If you were thinking about upgrading to an A1200 or A4000, think again. With a GVP A530 Accelerator upgrade, your A500 will be 14 times faster than a normal A500, almost nine times faster than an A1200 and over one and a half times faster than the mighty A4000 030 (see chart below).

AT NEW LOW PRICES!

PC EMULATOR

FOR USE WITH HD8+ or A530 For extra power and flexibility

you can also use GVP's custom expansion slot (mini slot) to fit a GVP PC emulator. This compact circuit board turns your Amiga 500 into a fully featured PC compatible computer, capable of running thousands of PC software titles, including Windows and MS-DOS 6.

- 80286 16MHz processor
- Norton SI index of 15
- Compatible with MS-DOS version 3.2 or later
- Windows 3 x compatible
- Includes 512K of FAST RAM
- Built-in video adaptor emulates VGA/EGA (mono), and Hercules
- Socket for optional 80287 co-processor
- Hard drive compatible
- Emulation support of Parallel and Senal ports, sound, realtime clock, CMOS RAM and extended memory

PC EMULATOR INC VAT - EMU 0500

RAM EXPANSION

A GVP HD8+ Hard Drive will have an immediate effect on your Amiga. Where you used to constantly swap disks, wait for files and programs to load and sit around waiting for disk accesses, you will now be pushed to keep up with the speed of your Amiga. Hard drives are used for the same storage purposes as floppy disks, but can hold a great deal more information and access this data much more quickly.

The A500 HD8+ (pictured above) provides the ultimate in hard drive performance, it can also increase the memory of your Amiga by up to 8Mb, support up to six SCSI devices and provide PC compatible emulation via its custom expansion slot (mini slot) see left.

40MHz ACCELERATOR + HARD DRIVE + RAM EXPANSION

The GVP A530 is a unique combination of a Hard Drive, RAM upgrade and an Accelerator. Inside is a full Motorola 68030EC processor running at 40MHz, making your A500 faster than you thought possible - almost nine times faster than an A1200. And, fitting a PGA maths co-processor (40MHz 68882, ref: UPG 1982, £129 inc VAT) can improve this still further, with some operations being 300 times faster than an A500. In addition you can add up to 8Mb of 32-bit RAM, which further enhances performance.

FASTER THAN AN A1200 or A4000 030 An A500 with the GVP A530 fitted will be considerably faster than either

the A1200 or A4000. This is possible because the A530 uses a 40MHz 68030EC processor, whilst the A1200 uses the slower 14.19MHz 68020EC processor and the A4000-030 uses the 25MHz 68030EC processor.

Features include:

40mm 68030cc Processor (the A1200 has

a slower 14MHz 68020EC processor)

 Up to 8_{Mb} of 32-bit Memory, 1_{Mb} of 32-bit Fitted PLUS Same Features as HD8+

Cracking the Shell

Mark Smiddy demystifies one of the most powerful, and yet most misunderstood, features of the AmigaDOS Shell - re-direction.

e-direction: even the term is enough to make your brain itch. It describes a technique where the console window's input and output stream handles are changed to some other file handle. A file handle could be a real object on disk or another virtual terminal: AmigaDOS will not know the difference. (Actually, that is not entirely true, but I'll come back to that shortly.) It all sounds rather hair-raising, but once you get the hang of the terms it falls into place in an instant.

What it means in plain English is this. Normally you deal with AmigaDOS through a "console window" - a window which displays simple text input and output. When you type a command, you see it onscreen; when AmigaDOS "replies", you see its message on the same screen. Re-direction simply means taking input from another file rather than the keyboard, or sending AmigaDOS's output messages to another file instead of the screen. This is done by changing the file "handles", which are analogous to handles in the CB radio world - ways of identifying a file, so AmigaDOS knows which file you mean.

Now, what do we mean by a file? A file is a named object referencing

zero or more bytes on a massstorage medium - but we never describe it as such. Work you have saved from a piece of software - an AmigaDOS command - is a file. (It could be argued that even the Kickstart ROM is a file, albeit a very large one.) We use the term "file" as an analogy because the effect is similar to paperwork stored in a filing cabinet. Likewise, we arrive at the term "filing system" to describe the complex software and hardware that looks after the files.

When the operating system grants access to a file, it returns a 32-bit address known as a BPTR (BCPL pointer) to a "lock". The lock uniquely identifies the file by its device handler (say trackdisk) and its physical position on the storage medium (a sector number). Of course, you neither need nor want to be bothered with any of this. A lock is also called a "handle" - the analogy being something you can grasp hold of. The terms "lock" and "handle" can actually be used interchangeably, although "lock" is the more common term in programming circles.

LOCK PICKS

Locks are worth discussing in more depth because they are central to

BEGINNERS

If you are new to the Amiga, the very idea of AmigaDOS - an dinvironment where you have to learn and type commands, one at a time - might seem a little daunting. Why not just stay within the comfortable confines of the Workbench and handle the tricky bits with a CLI utility like Directory Opus or SID?

There are a number of reasons, but "eclecticism" is a good one. This greasy adjective is typically used in the art world meaning to be selective. I choose it to illustrate a point: AmigaDOS is full of big. strange-sounding words that mean little until they are applied. An AmigaDOS user can be eclectic by choosing the best of several similar commands to achieve a similar goal. The SID or Workbench user must remain within the confines of the application's design - no matter how open-ended it purports to be.

Few people would disagree that many operations are more easily performed from Workbench, but very few operations can take full advantage of the machine's multi-tasking capabilities. For instance, what if you wanted to copy some files from one place to another?

BEGINNERS START HERE BEGINNERS

With Workbench you simply drag the respective icons from the source to the destination - from AmigaDOS you have to enter a command.

Now what if you suddenly realise you have copied the wrong loons? You have to wait until Workbench finishes, go back and delete them, and start again from scratch. This can happen when you use AmigaDOS but you can stop the command immediately - so the total time to complete the operation is much shorter. In addition, AnigaDOS allows you to select files by group much more accurately than is possible from Workhench. It also affords simpler access to a range of public domain and shareware utilities that can only be accessed from the Shell environment.

AmigaDOS is powerful and perhaps a fittin difficult to learn - Workbench is great for everyday tasks when you are not in a hurry. The two systems complement each other wonderfully. You can "get at" AmigaDOS by opening the Shell icon you'll find it on your Workbench disk, Even if you have never done so before, try it now - you have nothing to lose.

the process of redirection. AmigaDOS has several kinds of lock. An exclusive (write) lock grants the handling process sole access to a file: nothing else can read or modify it. A. shared (read) lock is the opposite: any

number of processes can receive access to the file. Once shared access has been granted, AmigaDOS will not grant exclusive access. (Think about that for a moment, it's quite sensible.)

AmigaDOS commands create and delete locks constantly without ever bothering you. However, certain operations are not possible on locked items. For example, if a file has been opened by some application and you try to delete it, AmigaDOS will fail with the message: "not deleted: object in use". Similarly, you cannot make an assignment to a file because the lock information contains the type of object (file or directory).

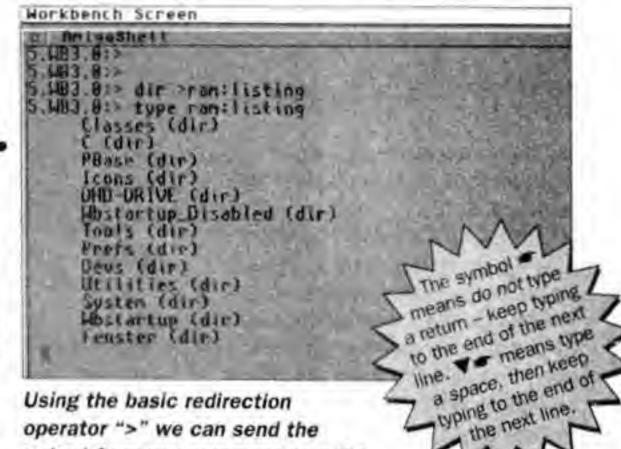

This basic knowledge of files and locks is not essential to understanding re-direction, but it helps. To summarise: files are like doors. Once a file is locked it cannot be opened; and an open file cannot be re-opened until it is closed.

INFORMATION FLOW

A transfer of information between two devices is often called a data stream because data is said to "flow" between the two places. This is quite unremarkable until you try to think of a console's input and output stream handles. How can a console (the Shell window) have handles?

As far as AmigaDOS is concerned, every console is two open files: one read, the other write.

Anything you type at the keyboard - the input stream (CIS or Console Input Stream) - is delivered to the input handle, and anything a command sends back is written to the output handle or COS (Console Output Stream). Re-direction enables the user to temporarily alter

output from any command to a file.

either or both of these streams for the duration of one command.

This might sound about as useful as a chocolate fireguard, but it is one of the most powerful features in the Shell. It enables us to send output from a command to a file, or control commands based on the result of some other operation. Three operators are used to indicate redirection:

> xyz Re-direct current output stream to XYZ.

>> xyz Append current output stream to XYZ.

< xyz Take input stream from XYZ.

The re-direction operator is followed by the name of any legitimate file (including a path) and can appear anywhere on the command line after the command itself. By convention, the operator is usually placed immediately after the command, but this is not necessary.

NEW DIRECTIONS

The most useful re-direction operator is ">" or re-direct output. When the Shell encounters this it takes the next phrase on the line and attempts to open it as a file. If the operation is successful, the command's output is sent to that file. Here's an example:

1>DIR >RAM: Listing I>TYPE RAM: Listing

continued on page 110

Workbench	Screen
o Anigas	hell
5.MB3.8:> 5.MB3.8:> Hello Wor	; re-direction using >> in append mode!

The ">>" operator is used like ">" but appends the output from a command to an existing file.

AMIGADOS

TYPE is used to view the file created by Shell – although you could use MORE or MULTIVIEW (AmigaDOS 3) just as easily.

White-space can be included between the operator and the filename thus:

1>DIR > RAM:Listing 1>TYPE RAM:Listing

but this is unnecessary. Use whichever you feel comfortable with and stick to it.

Generally speaking, re-direction files are temporary, so they would be stored in the **T**: assignment. This is generally set to the **RAM**: disk and is expected to contain only temporary files. Therefore it is good practice to use this in any lines that employ redirection:

1>DIR > T:Listing 1>TYPE T:Listing

OUTPUT RE-DIRECTION (APPEND MODE)

When output is being sent to a real file – that is, not a terminal or some other non-filing-system (disk) device – then you can make use of the append mode. This is similar to normal output, but every time a new command line is entered, the output is tagged on to the result from the last. This is similar to the JOIN command. Append mode output redirection is achieved using ">>name". Here is a tediously clichéd example, for want of a better one.

1>ECHO >T:Hello "Hello" NOLINE 1>ECHO >>T:Hello "world" 1>TYPE T:Hello Hello word

In AmigaDOS 2 and above, if the file does not currently exist it will be created for you. Be extra careful to remove such temporary files created in scripts – they will cause havoc if the script is executed more than once and the bug can be a beggar to find.

INPUT RE-DIRECTION

Re-direction of the input stream is not usually necessary from AmigaDOS 2 and above. It's been

The console device CON: can be used as a file, even with re-direction. Each "directory" is a position on-screen.

```
Morkbench Screen

5.M3.8:> SEIENV Count 1

5.M3.8:> GEIENV Count 1

5.M3.8:> GEIENV Count 1

5.M3.8:> EURL < Env: Count 1

5.M3.8:> EURL < Env: Count 1

5.M3.8:> EURL < Env: Count 1

5.M3.8:> GEIENV Count 1

5.M3.8:> GEIENV Count 1

5.M3.8:> GEIENV Count 1

5.M3.8:> ; note the original variable is not changed!

5.M3.8:> ; we can copy it back if required for a counter...

5.M3.8:> ; we can copy it back if required for a counter...

5.M3.8:> ; with a line like this: COPY ENV: que TO ENV: Count 5.M3.8:> ; with a line like this: COPY ENV: que TO ENV: Count 5.M3.8:> ;
```

Reading variables using "<" is fiddly but unfortunately it is the only option if you have Workbench 1.3.

replaced by environmental variables which are much more convenient. For instance, the following is valid in AmigaDOS 2+:

1>SETENV Count 1
1>EVAL \$Count + 1 to ENV:Count
1>GETENV Count
2

Shell expands the second line automatically, so **EVAL** reads the line thus:

1>EVAL 1 + 1 to ENV: Count

This is not possible in the earlier versions, so we have to use a trick with an input re-direction operator like this:

1>SETENV Count 1
1>EVAL <ENV:Count >NIL: V

OP=+ VALUE2=1 to ENV:qwe ?
1>GETENV qwe
2

This looks a little frightening at first because the line is so much longer – be thankful if you have a more recent version. It breaks down like this:

EVAL Is the command itself – EVAL comes from evaluate meaning to calculate an expression.

ENV:Count Means "take input from the file 'ENV:Count'." This file is automatically created in the ENV: assignment by SETENV.

>NIL: Sends output to the NIL: device. NIL: is a dummy device (described later) and this operation suppresses unneeded output.

OP=+ Describes the operator to use (addition). A keyword (OP) is used so

the primitive parser in 1.3 can work out where it is.

value2=1 Send the value to the calculation. value2 is a keyword used as above.

to ENV:qwe Tells
EVAL where to put
its result. The result
cannot be placed
directly back in the
same file it has
been taken from
because the file is

already in use
(locked) by the
Shell. If you need to
use the result in a
script loop, the
temporary file "qwe"
should be copied
over the original, like
so:
1>COPY ENV:
qwe to ENV: Count

? This triggers EVAL into interactive mode and is the single most

important part of the command line. The query operator is usually used to get help from any command, but it also allows the parser to retrieve output from the current input stream interactively. The result of this is that **EVAL** gets the first argument from the environmental variable, **Count**.

Don't worry at all if this seems beyond you at this stage – it is a

difficult area and one which you will learn with practice.

RE-DIRECTION WITH DEVICES

I mentioned that a console window looks like a pair of open files. This means that the console device looks like two open files, so the following would seem to be true.

1>DIR >CON: Shell error: unable to open redirection file.

In late releases such as AmigaDOS
 3, this is a valid statement, but should not be used for compatibility.
 If later Shells fail to open the file the error is returned like this:

1>DIR >CO: dir: unable to open redirection file.

The console device looks like a disk drive with lots of numbered directories, each one representing a position on the screen. When it's used you should specify a "directory path" corresponding to the position, size and name of a window to open like this:

1>DIR >CON:5/10/500/199/List

You will note that the window closes as soon as the listing is completed. This is because the console "file" is closed by the Shell as soon as the command is completed. You can prevent this happening in AmigaDOS 2 and above by specifying the CLOSE and WAIT switches as part of the

path:

1>DIR >CON:5/10/500/199 - /List/CLOSE/WAIT

Other AmigaDOS devices can be used in the same way. For example, you can use re-direction to get a hard copy of all the files on a disk like this:

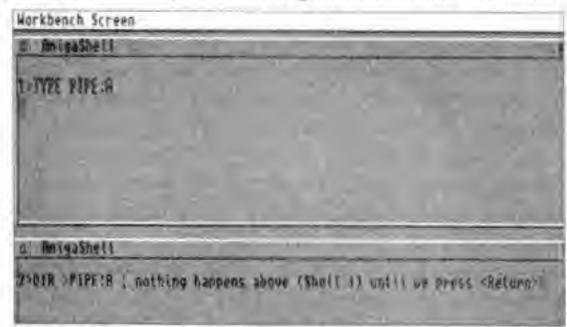

1>DIR >PRT: DF0: ALL

Possibly a more interesting example uses the **pipe** device. The **PIPE** must be "mounted" before it can be used. In version 1.3 this is a simple matter of entering:

MOUNT PIPE:

But in release 2 and higher, the PIPE's icon should be moved into the DEVS/DOSDrivers drawer and the machine re-booted.

In this example, I'll be transferring information between two

Pipes can be used effectively with re-direction – for instance, they are ideal for communicating between two Shells without a temporary file.

Shells (indicated as 1> and 2>) without using a temporary file:

1>TYPE PIPE:A 2>DIR >PIPE:A ALL

Note how **TYPE** seems to jam while it waits to receive output from the **PIPE**:

SHUT UP!

Since any device can be used for output, it is also possible to tell a command to shut up completely by channelling its output to the dummy sponge device, **NIL**:. Consider the following example:

1>LIST >NIL:

Such fiddles do have a purpose though. For instance, you might want to suppress output from some command while it works. While many commands support a QUIET mode, a few do not. Moreover, when the QUIET switch is used, errors are still reported to the current window (*). Re-direction to NIL: fixes this one permanently. Study this example, but don't execute it unless you are about to re-boot your machine.

1>DELETE >NIL: RAM:#? ALL

o Fish disks this month

- instead, I've taken the
opportunity to look at
some of the disks sent
in by PD libraries, disk magazines
and authors of PD, shareware and
licenseware.

Speaking of licenseware, some people are against including software that's sold in this way in the PD World column - they say that in effect it's commercial software. However, personally I think that it's a perfectly reasonable way for authors to get some money from their endeavours - and an easy way for people to pay shareware fees, since in essence that's what you're doing when you buy licensware: a percentage of the sale price goes to the author. That way, they don't get as much money per program as if it were released as true shareware, but at least they're sure that every user has paid something - which, sadly, is not the case with normal shareware.

Anyway, enough of all this. Let's get down to the software!

LSD TOOLS 127

Roberta Smith DTP disk UT547 LSD Tools 127 is a fairly standard

collection of utilities, encompassing some useful programs - such as ToggleClick, which turns that annoying floppy disk drive clicking off, and CKick, which loads any KickStart (for people who run, say, KickStart 2.04 most of the time, but occasionally need to use 1.3 to access a certain program). However, there are a couple of rather less useful utilities included too, like ClickHere, which puts a tiny requester on the screen with the message "click here" in it. Being an obliging sort of soul, you do - and the program quits. What a marvellous piece of programming ingenuity that is, and many thanks to LSD for including it on the disk. Very witty, I don't think.

Here's a list of the more useful things on the disk:

- Skick and Ckick Load other kickstarts
- . SD Super Duper copier
- ToggleClick Turn floppy drive clicking off
- TWC Comms package
- Logicshop Create and test logic diagrams
- · Viruschecker
- . Dost SnoopDOS clone
 - . Trashmaster Replacement for

BEGINNERS BEGINNERS START HERE BEGINNERS

What is PD?

PD is a general term which many people incorrectly use to refer to all freely-distributable software. In fact, PD (which stands for Public Domain) software or "freeware" is only one branch of this area; the other main one is shareware.

Essentially, freeware may be copied and used by anyone, although some authors place restrictions such as not allowing a PD library to charge more than a certain amount for the disk.

Shareware, on the other hand, should be treated more like commercial software. Although you are allowed to copy and pass around shareware programs, if you like one then you should pay the requested fee to the author - it's normally around £15 or less, and often entitles you to an upgraded version or a printed manual. Paying your shareware fees encourages software authors to write more programs - and if they don't, the Amiga scene will be a poorer place. Don't think that you're paying money for nothing, either - often hundreds or even thousands of hours of work have gone into creating a program, and it's only right that the programmer receives some reward for his or her hard work.

The third branch of software that we cover here is called

licenseware. This is a form of shareware which is licensed to one (or more) PD libraries. In essence, when you buy a licenseware program you are buying shareware and paying the license fee at the same time. For this reason, you should treat any licenseware that you buy exactly as you would treat a piece of full-price commercial software – don't pass it around to your friends. You've only bought the right to use it yourself.

Can I pass other people copies?

Yes – that's the way that PD reaches a wider audience. Just make sure that you have followed the author's requirements for distribution. These are normally things like not charging more than a certain amount for the disk, not altering the program, or making sure that all the original documentation is included on the disk.

You can also pass on shareware – but not any registered copies of programs. If, when you pay your shareware fee, the author sends you an improved version of the program, then be careful not to give that out. Only pass on unregistered shareware.

You should not, of course, pass on licenseware – it should be treated in the same way as registered shareware.

SOFTWARE for free

This month, it's a Fred-Fish-free zone as Ian Wrigley catches up with some home-grown low-cost and no-cost software...

PowerData enables you to use PowerPacker transparently to compress all your files – regardless of the program you created them in.

the standard Trash.

I'm not particularly keen on the fact that the disk autoboots but doesn't have a Workbench display – you have to do everything from the Shell. And since the number of commands included in the C: directory is somewhat limited – PPMore, Run, Type and the Nuke anti-virus program are all that's there – all you can do is run the programs on the disk and read their documentation. Why on Earth at least the Dir command wasn't placed on the disk is totally beyond me.

Still, I guess this is a reasonable collection of utilities. And since Roberta Smith DTP only charges 90p per disk plus 50p post and packing, you may well decide that it's worth getting.

Value for money 7/10

POWERDATA

Round about Amiga Shopper 25, I looked at a program called

PowerData, which would have been great had it worked. Well, now it does – the author, Michael Berg, has upgraded it to fix the bugs (which were apparently due to a feature of WorkBench 2.1 that wasn't implemented in earlier versions of WorkBench).

Quite simply, the program transparently adds compression – using the popular cruncher PowerPacker – to any program, with no user interference required. So when you save a file, it will automatically be compressed for you, whether you're in Protext, DPaint III or whatever. Open a file and it will be decrunched before the program attempts to read it.

This is an excellent idea, and one that's been popular on computers like the Mac for some time. It can drastically reduce the amount of space that files take up on your hard disk, and is ideal for anyone feeling the pinch of limited

RATING THE PROGRAMS

Just to be awkward, I rate the software that I review in two different ways, depending on what it is. Disk magazines, collections of clip art and the like are given a "value for money" rating, since you're essentially paying for one thing, or group of things, on the disk.

Single programs which appear in a collection of others, or programs which I've downloaded from bulletin boards, are given a "program rating", which reflects how good I think they are, taking into account usability, bug-proofness, my own particular (or should that be peculiar?) tastes and so on. Both ratings are out of a maximum possible 10.

storage space.

You control the program via an easy-to-use Preferences requester, where you have a surprisingly large range of options. For instance, you can choose to compress or not compress files depending on their names – not attempting to further compress archives created with a program like *LhA*, for example – and set the level of compression depending on whether speed or file size is more important to you.

The only problem with PowerData isn't really the program's fault at all. It's so easy to use (once it's set up. you don't have to do anything else with it at any time) that you tend to forget it's installed on your Amiga. And since it makes sense to have the program work on all files (even icons), pretty soon almost the entire contents of your hard drive will be PowerPacked. But then when you give disks to other people, they'll find that they are unreadable until they've been decompressed - something that you'd probably forgotten all about. The easy solution, of course, is to let your friends have copies of the program too - and that way it will soon propagate throughout the whole Amiga world.

PowerData is shareware; it displays a requester each time it's started, and will quit after 20 minutes of use. But the shareware fee is only \$10, and it's so useful that I encourage everyone to check it out and then register. With luck, this will become one of the most popular Amiga shareware programs around!

Program rating 10/10

COMMUNICATE

Your Choice PD

Communicate is a PD program written in compiled AMOS by John Cassar. It's intended as an educational program for anyone who needs (or wants) to learn any of a range of "languages": two-handed sign alphabet, one-handed sign alphabet, deaf-blind sign alphabet, Braille, semaphore, "flags" (ship signalling flags), Morse code and a "Naughts (sic) and Crosses" code. There is also a font on the disk for the Naughts and Crosses code, if you have a burning need to word process in such a manner.

The program itself is impressive, and includes well-drawn images of the flags, hands and so on. You can be tested by the program, can get it to show you any given letter in the language, and can even enter a sentence and have it display the signals, symbols or whatever for that sentence. This is where the graphics really do look slick: for letters such as "H" in the two-handed sign alphabet, for example, where one hand slides across the other, the gesture is actually animated excellent. (The usual problem with AMOS programs, unfortunately, means that I can't screengrab the program, and you couldn't see the animation anyway, so you'll have to take my word for it...)

If you have any desire to learn sign language or semaphore, I highly recommend that you get hold of a copy of this program. I tend to think that Morse code is better learned using a program which signals to you, rather than displaying the dots and dashes on the screen, and indeed Braille teachers would probably recommend that you use a textbook where the characters are embossed rather than just looking at them on the monitor. However, this remains an excellent program, and one well worth checking out.

Program rating 9/10

EDWORD PROFESSIONAL v4.0

EdWord has been around for some time - version 2.2 was released enough memory to do that), and you can copy and paste between them. There's even a split screen option, so that you can view two documents at the same time – and the amount of the screen that each document has can be altered by clicking and dragging on the split marker. This is something that I haven't seen in any other text editor on the Amiga, and it's a feature that's incredibly useful.

- Macros. This seems to be a requirement in Amiga text processors these days, and EdWord's is just as good as any other's.
- PowerPacker support. The program will optionally decrunch any files which have been compressed with PowerPacker before it attempts to read them in. Of course, if you have PowerData then you won't need this feature...
- A "text casing" feature. Specific keywords can be forced to a specified case – for example, all BASIC keywords can be forced to capitals, regardless of how you originally typed them. This requires a configuration file listing those keywords, and a couple are supplied with the program.
- An ASCII table of characters, along with ASCII codes, so that you can insert any character into the document just by clicking on it.
- · A built-in RAM virus checker.
- · An auto-save feature.

EdWord has always been good, if not quite a word processor, and the new Professional version is a rather fine text editor – well worth checking out.

about a year and a half ago, and was featured on an Amiga Shopper cover disk (the one with issue 25 – if you want to order that, see page 106). Now version 4.0 of this great £10 shareware program is out – and it's well worth getting hold of if you need a text editor.

The list of features is huge, but here are some of the more impressive ones:

 Multiple documents. Up to 15 documents can be edited at a time (assuming, of course, that you've got Add to this things like one of the fastest word counters I've come across, "live" scrolling as you drag the scroll bar around, and many more equally impressive features, and EdWord Professional becomes almost mandatory if you need a text processor. My only complaint is that the unregistered version produces a requester every three minutes or so, reminding you that you haven't paid your shareware fee – but since the cost is only £10, and includes things

like over 160K-worth of AmigaGuideformat documentation, I'm sure that any users will soon register anyway.

Worth investigating if you need a text processor. And if the author added a couple of things like automatic word-wrapping, it would make a damn fine word processor too. Check it out.

Program rating 10/10

PAY ADVICE ANALYSER

Virus Free PD disk 3127

This is a £5 shareware program by Richard Smedley, written after a friend was complaining to him that it was hard work keeping track of his weekly payslips. In essence, the program is a basic database, but one that's been customised for just the one task: recording payslip details for easy perusal.

The data fields are pretty simple, and should cover most of the things that you'll find on a standard payslip: things like basic pay, extra pay, PAYE, National Insurance contribution details and so on. The program automatically calculates the totals and your net pay, giving you a quick check that the details on the payslip are correct, Once you've entered the details, you can save the file with a password, to prevent anyone else seeing just how much money you make.

The demo version of the program has two features disabled: Send to printer, which, as you'd imagine, prints out the whole list; and Put into Date Order, which will order your entries chronologically - very useful if you've entered a whole slew of payslips into the program for the first time regardless of order. Because these two features are pretty much essential, anyone using the program is bound to pay up the shareware fee, but personally I don't like programs with features disabled - it seems to me that this goes against the "honour" concept of shareware, though I suppose you do still get to test whether you like the program. Still, each programmer to his own, and I'm sure that some people will find this program useful. However, do remember that, as Richard says in the documentation, you must still keep all your payslips at least until the end of the financial year even if you use the program to record all the details - a computer record won't be any use in case of a dispute. And, of

GET IN CONTACT!

If you've written is or discovered – any PD, shareware or licenseware that you think should be reviewed in these pages, or if you've got any other comments or suggestions, write to lan Wrigley c/o Amiga Shopper, 30 Monmouth Street, Bath BA1 2BW. Alternatively, you can contact lan on cix as 'iwrigley', or on the internet as 'ian@vampire.demon.co.uk'.

Pay Advice Analyser: no more ferreting around in the bottom drawer for your payslips when the Internal Revenue invite you round for a nice "desk audit"...

course, there's always the danger of a hard disk crash...

Program rating 6/10

POOLS-WIZARD JUNIOR

This is an AMOS program designed to improve your chances at predicting score draws and generally winning a fortune on the pools. It's public domain, although for £10 the author will send you a more complete program (called, unsurprisingly, Pools-Wizard) which includes an improved prediction engine and one or two other extras.

I've seen a number of similar programs in the past, and I must say that this is one of the easiest to use - and, indeed, one of the best looking. Data entry is simple, and you don't need to enter the team's full name every time - handy if you start using it half-way through the season and have to enter something like "Hamilton Academicals" a dozen times. Instead, you can just enter the first portion of the name and the program will replace it with the full name. If there are two or more teams which match the first portion of the name, hit the + key and the next one will be displayed.

After you've entered the results for a few weeks, it's time to start

making predictions. Again, this is simple: enter team names and the program will tell you whether you're likely to be a millionaire at the end of the day.

At the end of the season, of course, teams will be promoted and relegated - and here you can really see how much thought has gone into the program. Teams can be moved about through divisions with simple button clicks ("relegate" and "promote", for instance), and should the powers that be decide to alter the way that points are awarded for wins, draws, losses and so on, this too is easily alterable by simply clicking on the appropriate requesters.

All in all, this is an impressive program and one that pools punters will no doubt want to try out. The only problem is that we're already well into the footy season - so entering all the results will be something of a tiresome process. Perhaps the program's author, Paul Nicholls, could think about sending out updates of league positions and results on disk for a subscription fee? Anyway, it should be available from the major PD libraries by the time you read this - Paul's sent it to most of the major ones, but

recommends Penguin PD, who only charge 90p per disk and who have already written back to say that they'll be including it in their library.

Oh, and does it work? Well, Paul says that it performs at least as well as one other popular prediction program. and better some of the time. The fact that its bigger brother (the one you get if you send him

£10) has an "improved" prediction mechanism suggests that perhaps you won't actually win that £2 million next Saturday, but it's good for interest and a laugh anyway. If you use it and you do make a fortune, do let me know!

Program rating 8/10

DISKMANAGER III

Kew=II disk U1021

Way way back, many centuries ago (well, in Amiga Shopper 20, anyway). I reviewed DiskManager 2 by Andrew Woods. And here it is in an all-new.

Pools Wizard

Pools-Wizard Junior: it's a funny old game, Saint... and so is trying to work out the dividend formulas!

improved version.

DiskManager keeps track of your floppy disks for you, by creating a database of their contents. Scanning disks is a simple process of inserting them and choosing Scan Disk from the menu (and then clicking OK on the annoying "you haven't registered yet" shareware requester). Once you've catalogued all your disks, you can then do a number of things with the database. For instance, you can find a specific file on any of the disks - since you can enter a title and comment for each disk, of course

DEPT AS, 43 BADGER CLOSE, MAIDENHEAD, BERKSHIRE SL6 2TE PHONE 0831-649386 ALMOST ANY TIME

FOR A CATALOGUE DISK SEND THREE 1ST CLASS STAMPS, OR FOUR 1ST CLASS STAMPS TO INCLUDE MY FISH CATALOGUE DISK FISH 1 TO 925

SMALL BUSINESS PACK only £6.00 inc P&P Six disks to help you with your finances, almost all you will ever need.

VISION & SOUND 2000 only £2.00 inc P&P Play it - hear it - see it - show it - read it . 2 disks chockablock will almost do it all.

you'll then be able to find the disk from that huge pile balanced precariously on the edge of your desk, won't you...? Even more usefully, you can look for disks with more than a certain amount of free space on them - great when you really need to back up your work files but you can't remember which of those cryptically-named floppies only has a couple of files on it and which are full to the brim.

The program recognises a range

just remember to label it ... Program rating 9/10

PLOTTERS

PDSoft disk V1068

PDSoft do a number of this type of disk: collecting several similar programs and sticking them all on one floppy. Some are more useful than others, and occasionally it looks as though the programs have been selected by title rather than by function - as you'll see with this

Total: 3 Date: 17-01-1992 Vitle: DiskHanagerII	FYNT 14 3:38:51	# Full: 67	Page: 1 of 2

DiskManager III: keep a track of your floppy disks with this great utility - it even remembers how much free space there is on each. Now that's handy!

of different program types, so you will be told that, for instance,

"makeamillion" is an AMOS file while "begtobank" was created in your word processor. All useful stuff, and anyone thinking of setting up a PD library, or anyone with a large number of floppies lying around, would do well to check this program out. My only real complaint is that in the report view you can't do anything such as quit from the program even though the menu items are still enabled. It would be nice if the program either allowed you to do such things or at least dimmed the menu items so that you know to click on the "OK" button before trying to do anything else. Still, this is a minor guibble, and certainly doesn't detract from the program's usefulness.

DiskManager III is certainly well worth its £10 shareware fee, just for the "search for free space" feature and floppy-only users needn't worry: it works fine without a hard drive, storing the database on the same floppy disk as the program itself. But collection. Regardless of that, though, the disk contains a couple of useful graph plotting programs, and is certainly worth checking out.

First up is Amiga Plot 1.3, a three-dimensional function plotter. According to the documentation, it "takes a function derived by the user, parses it into a partially compiled form and then calculates coordinates to be placed in the xyz system." What this means in practice is that you get the kind of cool 3D graphs that no-one knows quite how to create but everyone loves. Seriously, the program is fast, works well and gives you full control over things such as rotation of the image, the increments in x and y coordinates used to plot the graph and the range of both x and y axes. You can even save the image out as an IFF file - which is what I did to get the picture on this page.

PlotXY is a two-dimensional plotting program, which plots graphs from data points rather than from a formula - great for scientists and

Aniga Piut VI Ja 87/88 Joe Martin (C) Copyright

Amiga Plot: just one of the programs on PDSoft's disk V1068. Cool or what? (Actually, you even get two versions of the program, but we won't quibble...)

others who want to get a graphical representation of data. It deals with different types of graph - linear, linear-log, log-linear, log-log and histograph - and enables you to add grids, titles, legends for the axes and so on. There are even different options for the look of the mark used to show where each data value lies.

Finally on the disk is - Amiga Plot 2.0. Yes, for some reason both versions 1.3 and 2.0 are on the same disk. Perhaps it's because one of the programs is named "aplot" and the other "plot". Still, there's really no reason to have two versions on the same disk, and it would have been nice to see a standard, twodimensional function plotter included instead.

Version 2.0 has plenty of improved features over 1.3, although the basics are still the same; it's mainly user-interface considerations that have been changed, although the author does also claim a 10 to 15 percent speed increase.

Value for money 7/10

VIDEOBASE

I know, I know, I said that I wasn't going to review any more database programs unless they were something extremely special, but I thought that I'd give this one a mention since it was written by John Cassar, the same person who wrote Communicate (reviewed on page 112 this issue). It's a fairly standard video database program, created in AMOS, but it has enough useful features to be worth mentioning. For starters, it's rather more intelligent than most. As an example, if you enter a film time in minutes (85, say), the program automatically converts that to "1:25" - rather than stupidly assuming that you meant 85 hours, or asking you to re-enter because it doesn't understand.

Many of the fields have automatic values, which cycle as you click on them. The certificate field. for instance, cycles through U, PG, 12, 15, 18 and XX (there isn't room

for the third X). (Although in fact there's no such thing as a 12certificate video, unless I'm mistaken; the 12 certificate is for films only.)

There is room for five programme titles per video, and underneath there's a graphical and text display of how much of the tape has been used and how long is left - but for standard and long-play machines. This enables the program to offer a "find empty space" option - ideal if, like me, you've got loads of tapes lying around with a few minutes blank at the end of each one.

I've said it before, and I'll say it again: I don't really see why anyone would want to take the time to fire up their Amiga, load a program and then search through to find a specific videotape, Unless you've got whole roomsfull, it's quicker just to scan the labels. However, if you're the sort of person who really does want to do the whole thing on computer, Videobase is probably about the best around. And it's free, too.

Program rating 8/10

Disk magazines

There have been a few disk magazines sent in over the last few weeks - many from the "old faithful" crowd. Here's the pick of the crop...

DIGITAL DISK ISSUE 3

This is the third issue of Digital Disk, and it gets better with each issue. It's available free (issues 4 onwards will cost real money) and it's available from Digital Disk Publishing, 70 Donald Drive, Chadwell Heath, Romford, Essex RM6 5DU. Just send two blank disks (it's a two-disk mag) and a stamped. self-addressed envelope.

Contents include the running "interactive adventure", which is a narrative story with the story

Digital Disk issue 3: this disk magazine gets better with each issue, with game reviews, features on music and AMOS, and an "interactive adventure".

direction decided by the majority vote of readers. I'm not keen on the thing, I have to admit, but I'm sure that many people like it. There's a decent news section, which covers the Amiga and also the Atari ST family (the disk is multi-format, and available on the Amiga, ST and PC although the PC version has been postponed for a month or so, apparently to write a new front-end and put some new staff members in place). There's an AMOS tutorial. reviews of games, space for reader ads when some are sent in, features on computer and conventional music (sadly the authors seem to lean towards "house music" as a favourite style, but I suppose we can't have everything...), pictures, song lyrics (from most of REM's Automatic for the People album in this issue)... something, as they say, for everyone.

The only trouble with the magazine seems to be that there hasn't yet been much reader feedback - no letters, for example, on the letters page. With luck, as more people get to hear about the mag, this will change - it certainly deserves to succeed.

A "trial subscription" is £10 for four issues, or you can subscribe for a whole year for £26 (12 issues). However, if you mention Amiga Shopper when you subscribe, you'll get £1 off that rate. And you can't say fairer than that!

Value for money 8/10

NOTHING BUT AMOS

Nothing But AMOS (or N.B.AMOS for short) is, as you might have guessed, a magazine strictly for and written in - the popular AMOS programming language. Yes, written in, because the viewer is apparently the result of months of coding effort. It's certainly slick, with nice chunky 3D-effect buttons for scrolling and so on (although the scroll up and down buttons confused me for a while the upwardly pointing button scrolls down through the text). It's a shame that the programmer, Neil Wright, seems to have decided to only use the NTSC portion of the screen for

the text viewer, meaning that the bottom third or so is blank - why couldn't the text take up the whole screen area, as the pictures do?

The content of the disk is divided into articles, pictures and music. The articles are well written, and include plenty of program fragments. although the images aren't particularly wonderful.

Subscribing to N.B.AMOS brings a few extra benefits, along with the monthly disk magazine: reduced prices for disks from the PD library (£1 instead of £1.50), access to the source code of the disk mag for £4.99, and even a "debugging service" - send in your problem program and the team will attempt to debug it for you, free of chargel (Of course, Amiga Shopper's Code Clinic will also do the same for you,... this issue it's on page 46.)

N.B.AMOS costs £2.50 for one issue, or £24 for a full year's subscription. Cheques should be made payable to J Rutherford or N Wright, and should be sent to N.B.AMOS, c/o Neil Wright, 39 Riding Dene, Mickley Square, Stockfield, Northumberland NE43 7DL.

Value for money 9/10

MR AMOS CLUB DISK

And... yes, another AMOS newsletter! This one's from the Mr AMOS Club, which has been running for a little over six months - and has already got almost 850 members. Brian Bell, the bloke who runs the club, was responsible for the Charlie Chimp game that recently won the GamesMaster/Europress competition to design a game in AMOS - it was given away on the cover disk of our sister magazine Amiga Format's May edition.

The club's aim is, according to Brian, "to teach all budding AMOS users out there how to write winning software like Charlie Chimp and make a fortune of it all." The club is busy on a number of programming projects including a Streetfighter II clone (Editor's note: this is apparently some sort of (shudder) computer game, I understand), and

Some of the artwork supplied on the Mr AMOS Club disk - images so professional that they're worth the price of the disk themselves!

these will be explained in detail in the club disk magazine.

The magazine has a nice interface, and it's clear that the programmers are very accomplished AMOS coders. However, unless the disk is auto-booted the text face is nearly impossible to read - it's a very narrow, compressed face, and while I could just about make everything out on my monitor, it would certainly have been a real strain if the Amiga had been connected to a television instead. The text only covers half the screen - a good thing, since taking up the entire display would really have made things impossible. This really is a problem that should be addressed, though - it could well put many people off, especially since much of the text is in colour, which adds to the legibility problem. If you autoboot the disk, everything is fine - the font is a nice, chubby, easy-toread affair and covers the whole of the screen. But I didn't realise that this was the case for some time, and the designers should take into account the fact that many of us don't autoboot disks unless we absolutely have to.

The contents of the disk include programming tutorials, contacts information and so on, reviews of programs created in AMOS, and AMOS add-ons such as the compiler, along with some very nice artwork. I

looked at disk three, which contains a couple of great fonts and lots of characters for you to use in your own creations - there's a picture on this page of the contents of one of the files, and you can see just how professional it all is.

The actual programming tutorials aren't the very best that I've seen, but aren't too bad; and in the "advanced programming" section of the disk I viewed, Brian gives some good advice about how to pick subject areas that will make you the most money if you want to program commercially. Disk four will, he says, talk about marketing your products.

Even if you only get the disks for the artwork that's included, they're well worth the price. And the extra information thrown in means that they are an invaluable resource to any AMOS programmer, from beginner to professional.

Issue one of the club disk costs £1, issues two and upwards cost £2.50 in the UK, inclusive of postage and packing. The disks come out bimonthly, and if you send a cheque for more than one issue you'll get the new releases as soon as they're ready. To order, make your cheque payable to Brian Bell and send it to The Mr AMOS Club, 8 Magnolia Park, Dunmurry, Belfast BT17 ODS.

WHERE TO GET I

There are two main ways to get hold of Amiga PD and shareware: from a bulletin board or from a PD library.

The advantage of using a bulletin board (BBS) is that often the latest software is uploaded as soon as it's available. On the downside, you need a modem to connect, and you'll have to pay phone charges (and sometimes a

connection fee to the BBS as well).

There is a growing number of BBSs with a wide range of Amiga software available for download. Check out 01-for Amiga (071 377 1358) and the Cheam Amiga Bulletin Board (081 644 8714). Another good option is joining CIX (the Compulink Information eXchange), which not only has

Amiga software but also contains conference and file areas on a wide range of subjects. Many of the Amiga Shopper writers have accounts on CIX, so you can get first-hand advice on your problems, too. For more details, call CIX on 081 390 8446 (voice) or 081 390 1255 (modem).

If you don't want to use a BBS

or haven't got a modem, the other way to get PD software is from a PD house. Many advertise in Amiga Shopper, and there's a full directory overleaf. Expect to pay between 99p and about £2.50 per disk there's often a discount if you buy in bulk, too. As for the difference between companies which charge 99p and those which charge £2.50 - well, try both types. There are brilliant, totally professional PD houses which charge less than a quid, and total incompetents which charge more than twice that.

ACC HARDWARE PROGRAMMING MANUAL

THE perfect introduction to programming the Amiga's hardware using Assembly Language. Everything you will need to get started is included in the package. Through an integrated environment you can browse through the chapters, load and run examples and invoke the assembler. Topics covered include: Interrupts, Input, The Copper, Replayers, Audio, The Display, Sprites, The Blitter, Scroll Texts and more.

Price: Disk 1 (PD) £1.25, Disks 2,3 and 4 £5.00 each. Postage 60p per order. Amiga Shopper Offer: Disks 2,3 and 4, including postage, for £12.00. Ends Feb '94

Amiga Shopper featured Disk 1 on the coverdisk of their December '93 issue... CU AMIGA: '...should be on the shopping list of every budding programmer.' Rating 89%

BUYER BEWARE: The Inclusion of a PD library in this directory does not imply that Amiga Shopper endorses or recommends any PD library in any way. We can accept no responsibility for any dealings you may enter into or for any difficulties you may encounter.

. When you write to any of these libraries for a catalogue, include an SAE for its return. Some IIbraries ask that you send a blank disk as well.

. If a library is named in a review. this means that that library provided us with the disk reviewed. Given that PD can be freely copied, the same program may well be available legitimately from several libraries.

 If you run a PD library not listed here and wish to be included, or If you want to amend any information given, send full details and a copy of your latest catalogue to: PD Directory, Amiga Shopper,

30 Monmouth Street, Bath, Avon BA1 2BW.

COVERDISK:

Software's powerful music-making tool - SuperJAM! For the beginner, creating music isn't always easy. But now, with this fully-working program just pick your instrument, choose a style and jam away! In the shops now!

Step-by-step guide on how to make the best music with your Coverdisk

...All on the cover of the Amiga Format

than just a magazine

ON THE SECOND COVERDISK:

CANNON SOCCER – a crazy Christmas demo combines two top games, Sensible Soccer and Cannon Fodder, to create this mad mission-packed footy shoot-em-up.

CAFFEINE FREE – written in Blitz Basic, this great gravitating blaster includes full source code.

XAP – more shoot-em-up mayhem with this demo of an addictive and peculiar Shareware game.

software, SuperJAM!

special bumper Christmas issue

The ultimate games creator just got the ultimate guide

If you've got AMOS. then get this book! It explains what AMOS can do, and how to make it do it.

There are sections on program planning, producing 'readable' code, and screen handling.

AMOS is built to handle scrolling, animation, sound and music everything you'll find in a commercial game. And this book, from the makers of Amiga Shopper, shows you how it's done.

If you've got AMOS you're half way to creating your own gaming worlds. Don't stop half way - order 'Ultimate AMOS' today!

i Includes a disk containing all the code printed in the book, plus four complete AMOS games!

VE £10!

Ultimate AMOS' is available on its own at £19.95 but, for a limited period only, you can order 'Ultimate AMOS' and 'Get the Most out of your Amiga 1993' for an all-in price of £29.90. That's a saving of £10 on the combined RRP. See the form at the bottom of this page for ordering details.

Get the most out of your Amiga

'Get the Most out of your Amiga 1993' yours for only £9.95 when you buy **'Ultimate** AMOS'

FUTURE LEISURE BOOKS

These Amiga Format books are available in all good bookshops right now, but you can also order them direct from Future Publishing - and sending this order form off won't even cost you a stamp!

Please send me: (tick as appropriate)

..copy/copies of 'Ultimate AMOS' at £19.95 each

[ORDER CODE: FLB025A]

BUYING ADVICE FOR SHOPPERS

Whether you're buying over the phone or at a local store, here's our advice on getting what you want.

BUYING IN PERSON

- Where possible, always test any software and hardware in the shop before taking it home, to make sure that everything works properly.
- · Make sure you have all the necessary leads, manuals or other accessories you should have.
- Don't forget to keep your receipt.

BUYING BY PHONE

- · Be as clear as possible when stating what you want to buy. Make sure you confirm all the technical details of what you are buying. Some things to bear in mind are version numbers, memory requirements, other required hardware or software and compatibility with your particular model of Amiga (that is, make sure you know which version of Kickstart you have).
- Check the price you are asked to pay, and make sure that it's the same as the price advertised.

- . Check that what you are ordering is actually in stock.
- Check when and how the article will be delivered, and that any extra charges are as stated on the advert.
- . Make a note of the date and time when you order the product,

BUYING BY POST

As with buying by phone, you should clearly state exactly what it is you are buying, at what price (refer to the magazine, page and issue number where it's advertised) and give any relevant information about your system set-up where necessary. You should also make sure you keep copies of all correspondence both to and from the company concerned.

MAKING RETURNS

Whichever method you use to buy, you are entitled to return a product if it fails to meet any one of the following three criteria:

The goods must be of "merchantable quality".

- They must be "as described".
- They must be fit for the purpose for which they were sold or for the purpose you specified when ordering. If they fail to satisfy any or all of the criteria, then you are then entitled to:
- · Return them for a refund.
- · Receive compensation for part of the value.
- · Get a replacement or free repair. When returning anything, ensure that you have proof of purchase and that you return the item as soon as possible after receiving it. For this reason it is important that you check as soon as it is delivered to make sure everything you ordered is there and works as it is supposed to.

HOW TO PAY

Paying by credit card is the most sensible way, whether buying in person, by post or on the phone, because you may be able to claim your money back from the credit card company even if the firm you ordered from has gone bust or refuses to help sort out your problem.

Otherwise, you should pay by crossed cheque or postal order never send coins or notes through the mail.

GETTING REPAIRS

Always check the conditions of the guarantee, and servicing and replacement policy, so that you know what level of support to expect. Always fill in and return warranty cards as soon as possible, and make sure that you are aware of all the conditions contained in the guarantee.

BUYING PD

Even though PD software is relatively inexpensive, you should still apply the guidelines set out above, making sure that you confirm all orders as clearly as possible.

Shopping around is still important when buying PD because different sources charge different prices for the same disks. There is no set pricing structure for disks, but bear in mind that PD houses are, in theory, supposed to be non-profitmaking operations. (AS)

BUYINGBYMAIL

- . Before you send any money, ring the supplier to confirm that the item you want is in stock and when the delivery is likely to be made. Enquire about returning unwanted goods and the supplier's refund policy. Find out about hidden extras like postage and packing charges, and whether the prices quoted include VAT.
- Beware of companies that do not include an address in their adverts.
- . If ordering goods of more than £100 in total value, always try to use a credit card - if anything goes wrong, you will be legally entitled to claim against the credit card company, even if the retailer has gone bust. You may also get extra insurance - check with the credit card company.
- Always buy from the most recent issue of Amiga Shopper.
- When your order arrives, check everything carefully. If anything is missing, don't use the product at all - contact the supplier immediately. If something doesn't work, make the obvious checks such as the fuse, but don't try to fix the product.
- . If a problem does arise, contact the supplier in the first instance and calmly and politely explain your problem. In most cases these things are merely a mix-up or a misunderstanding that the supplier will happily put right. If you think you have a genuine grievance that has not been resolved, you might consider contacting your local Trading Standards Officer (the number will be in the phone directory - check the local council listing).
- Always keep records of correspondence with any mail order company you deal with and also make a note of where and when you saw the product advertised. False or misleading advertising is an offence, and suppliers must stick to what they've said in adverts.

Your Guarantee of Value
This magazine comes from
Future Publishing, a company
founded just eight years ago
but now selling more computer
ING magazines than any other
publisher in Britain. We offer:

Better advice. Our titles are packed with tips, suggestions and explanatory features, written by the best in the business.

Stronger reviews. We have a cast-iron policy of editorial independence, and our reviews give clear buying recommendations.

Clearer design. You need solid information, and you need it last. So our designers highlight key elements in the articles by using charts, diagrams, summary boxes, annotated photographs and so on.

Greater relevance. At Future, editors operate under two golden rules:

. Understand your readers' needs.

· Satisfy them.

More reader interaction. We draw strongly on readers' contributions, resulting in the livellest letters pages and the best reader tips. Buying one of our magazines is like joining a nationwide user group.

Better value for money. More pages, better quality: magazines you can trust.

The home of Britain's finest computer magazines:
Amiga Shopper, Amiga Format, Amiga Format Specials,
Amiga Power, PC Answers, PC Plus, Sega Power, Mega,
Commodore Format, PCW Plus, ST Format, GamesMaster,
Amstrad Action, PC Format, Totall, Super Play, Edge,
MacFormat, Future Music, Sega Zone and Game Zone

when AMOS was the only serious option for programmers that couldn't quite handle the throught of having to wade through more complicated languages.

like C and assembler to produce the same sort of results, but times are

Indeed changing Now that Blitz Basic Z is out on the market (thanks to our

the Amiga, and wonder if we really need it anyway?

Microsoft Word, probably one of the best word processors

on any system. Next month we ask if we'll ever see it on

erhaps one of the most annoying things about being an Amiga owner is the knowledge that the PC, a machine inferior to the Amiga in just about every respect, has gained much wider acceptance in the commercial world.

Okay, the Amiga's certainly king when it comes

to video and graphics work, but most businessmen wouldn't even consider it when looking for a machine to run a database, word processor or desktop publishing package.

Why should we care which machine some be-suited businessman buys, I can almost, by virtue of the cosmic aither that binds us all, sense you asking? Simply because if more of them were buying Amigas, we'd

be seeing lots more decent software for the thing. That's not to say that there isn't some decent. Amiga software – there is – but let's face it, it doesn't really compete with the sort of stuff available for the Mac or PC.

Next month we're going to be appraising this situation. We hope to talk to the big boys at Microsoft and Quark (makers of Word and XPress

WIN A YEAR'S FREE SUBSCRIPTION

What were the ingredients for the spagnetti sauce made by Clamenza in the film of The Godfather? Send your answers to "Tomatoes certainly", Amiga Shopper, 29 Monmouth Street, Bath BA1 20L. The closing date is Tuesday 7 December. The first correct answer wins. Last month's winner is Vicki Baldwin of Finchley, The answer was: David Jansson.

respectively) and ask them if they have any plans to port their programs to the Amiga. And if not, why not? We'll also be analysing how easy such a port would be.

There's another side to the coin that we'll be considering, too. Do we really need these programs when the new breed of Amiga software – Final

MJ

Writer, PageStream 3
and Wordworth 3, for
example – are
looking so good?
We'll be reviewing
the first of these,
previewing the other
two, and assessing
just how well they
compare with the
competition on Mac
and PC.

Part of the reason such top-quality software is available for the Amiga is because Commodore, with the A1200, have raised the power of the base Amiga.

Software manufacturers can be sure that there are a large number of potential users out there with powerful machines. Consequently, they can afford to make software that relies on this power. Next month's feature will be taking a look at what else Commodore could be doing to help.

Issue 34 of Amiga Shopper goes on sale Tuesday 4 January, and jolly good it will be too.

YOU'VE WON!

The ten winners of November's Score Some
Speed competition are: G Collwill of Bristol, A
Daniel of Sheffield, J Richardson of Cambridge,
C Perkes of Basingstoke, J Rumball of Wigston,
H Pelly of Haverhill, S Restorick of Liverpool.
D Wedinough of Beccles, R Nurdern of Risca
near Newport and M Cavers of Duns in
Berwickshire, Congretulations.

Each wins a copy of the AMOS Pro Compiler, courtesy of Europress Software.

Are there any products or subjects you'd like us to take a look at? Well, just drop a line to: Amiga Shopper,

> 30 Monmouth Street, Bath, Avon BA1 2BW.

new breed word processor

We've got ten copies of SoftWood's brand new Final Writer word processor, each worth £129.95, to give away. All you have to do is answer the questions.

Final Writer gives you the sort of typographical control that you'd normally expect from a DTP package.

arrival of Final Writer, the latest addition to SoftWood's range of word processors, back in Issue 32. Then we reckoned it could well be the first of a new breed of serious software for the Amiga. Well, now's your chance to decide for yourself.

We've got ten copies of the package to give away, each kindly donated by the good folk at SoftWood Europe, and each worth £129,95. And one of them could be yours for little more than the price of a stamp and envelope, and a few moments of your time.

So what can we say about Final Writer to whet your appetite? We could mention that it's going to be the new top-of-the-range word processor from SoftWood, with many more features than the company's already renowned Final Copy program. And we could mention some specific features.

Tell you what - let's mention some specific features...

For a start, the program can be driven almost exclusively via clicking on buttons contained in a tool bar (a means of operation that should be more than familiar to Deluxe Paint

users). You can switch between several tool bars depending on the kind of document you are using. They are also all customisable.

The customisability (great word, eh?) of the program doesn't end there. It will also enable you to create macros to automate common layout procedures.

But that's not

e announced the all. Oh no. Final Writer is fully PostScript-compatible. Not only will it print to a PostScript printer, but it will also send PostScript fonts (it comes

> supplied with over 110 of them) to other printers too.

A number of structured drawing facilities are provided in the package, and it is capable of importing graphics in both Amiga IFF and Encapsulated PostScript Format (the latter type being scalable). Just to get you going, Final Writer comes with 100 clip art images.

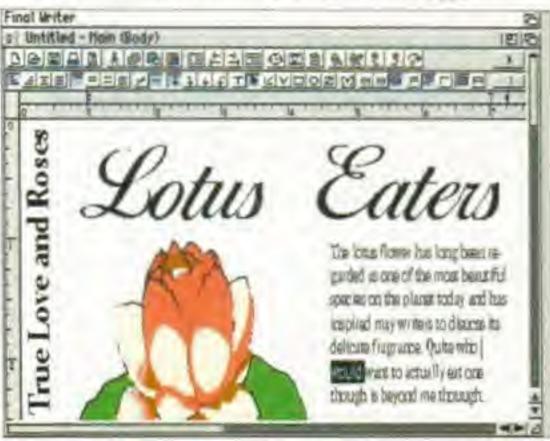

To win, answer

the questions in the box. Send your answers written on the back of a postcard (or a sealed envelope), along with:

- 1. your name and address,
- 2. which, if any, word processor you currently use, and
- 3. what two features you need most from a WP, to this address:

Write on Amiga Shopper 29 Monmouth Street Bath BA1 2DL

The closing date for entries is Friday 7 January. The first ten correct entries drawn from the editor's receptacle will win. Send only one entry per household and please state if you don't want your name included on a mailing list. The competition is not open to employees of Future Publishing or SoftWood. (AS)

It goes without saying that high quality colour graphics and text can be freely mixed in the same document.

THE QUESTIONS

- 1. Who wrote A Christmas Carol?
- (a) Umberto Eco
- (b) Charles Dickens
- (c) Gustav Flaubert
- 2. Who wrote the stylistic classic Madame Bovary?
- (a) Umberto Eco

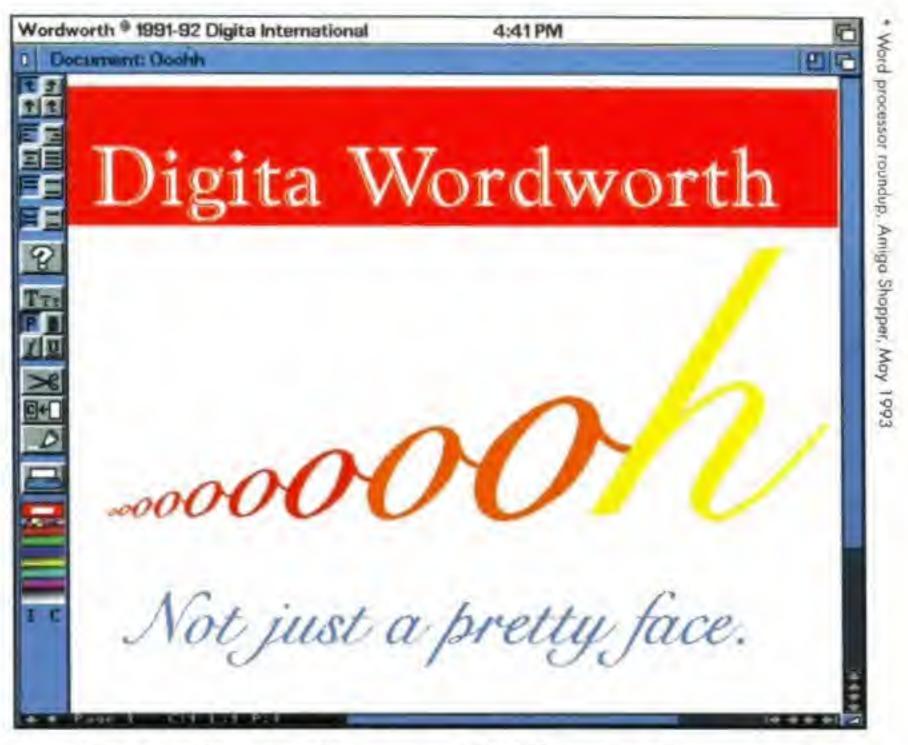

- (b) Charles Dickens
- (c) Gustav Flaubert

3. Who wrote the review of Final Copy back in Amiga Shopper 25?

- (a) Umberto Eco
- (b) Charles Dickens
- (c) Jeff Walker

WIN - WIN - WIN - WIN - WIN

Power Computing's latest 32-bit memory expansion for the Amiga 1200 is now available. The PC1208 combines exceptional value with incredible features. The original PC1204 4MB 32-bit memory expansion is still available, and is exceptional value.

Simm Technology - The PC1208 uses the latest industry standard 32-bit SIMM technology which allows you to use 1MB, 2MB, 4MB and 8MB modules.

Zero Wait State - The PC1208 never leaves the processor waiting around for data, Meaning your Amiga 1200 will run at its maximum speed. Simply adding either a PC1204 or PC1208 to your Amiga 1200 will increase its processing speed by 219%.

Real-Time Battery Backed Clock - Allows files to be date-stamped with the correct time and date so that you know exactly when they were created.

Ultra Fast FPU - With the addition of a maths co-processor intensive maths operations will be accelerated by up to fifty times. The PC1208 is the only memory expansion which offers the capability to take either PGA or PLCC type FPU's.

Easy To Fit - Fitted in minutes without the need to remove the computer's case. Does not effect your warranty.

PCMCIA Friendly - Unlike other expansion boards the PC1208 does not conflict with your Amiga 1200's card slot, using the PCMCIA friendly jumper even an 8MB SIMM can be used.

The PC1204 & PC1208 Memory Expansion for the Commodore Amiga 1200.

Power Computing's XL 1.76MB Drive* for any Commodore Amiga is now available. The XL Drive includes these many features:

Formats to 1.76MB - Using high density disks you can fit a massive 1.76MB on each disk.

Acts as a standard drive - Insert an 880K Amiga disk and the drive behaves like any other Amiga drive.

Fully compatible - Will read and write disks written on an Amiga 4000 internal high density drive.

Compatible with PC disks** - Also read and write high density PC disks using a suitable device driver.

Compact size - No larger than a standard 880K floppy disk drive.

High quality design - Uses a high quality Sony high density mechanism.

Easy to Fit - The external XL Drive simply plugs into the floppy drive port at the rear of your Amiga. The internal XL Drive simply replaces or adds to your existing drive(s). These drives can be installed in minutes and no soldering is required.

Software compatible - The XL series is fully compatible with all existing hardware and software.

Internal XL Drive £85.00
Internal XL Drive £75.00
A4000 Internal XL Drive £75.00

*Requires Kickstart 2 or above. **Requires Workbench 2.1 or above.

Next day £5, 2-3 days £2.50 Saturday delivery £10

THE BENEFITS OF DIRECT DEBIT

- By taking out your subscription on direct debit you can save £5, taking the price down to just £30 for your 12 issue subscription.
- You will still be able to claim all your subscription benefits.
- A further plus is that you won't have the bother of resubscribing when your subscription runs out. You'll be able to continue to receive Amiga Shopper as long as you wish.
- And remember, you can still cancel your subscription and your direct debit mandate – at any time. We will refund without question all payment for unmailed copies.
- To subscribe by direct debit simply complete the other side of this card in full and return this entire card in an envelope to the address above – no stamp required.
 - Please note: The wording overleaf is in the standard form requested by the banks. What will happen is this: as soon as the paperwork has gone through, we will request your branch to pay the reduced rate of £30 from your account to cover your subscription.
- When your subscription is due for renewal, we will give you at least 14 days notice and advise you of the amount to be paid from your account so you can continue to receive Amiga Shopper without interruption.
